Authors* Publication date* TBC  Material type* Publisher* Subject keywords  Abstract  The growth of the offshore wind industry in the last couple of decades has made this technology a key player in the maritime sector. A sustainable development of the offshore wind sector is crucial for this to consolidate on a global scenario of climate change and increasing threats to the marine environment. In this context, multipurpose platforms have been proposed as a sustainable approach to harness different marine resources and combine their use under the same platform. Hybrid wind-wave systems are a type of multipurpose platforms where a single platform combines the exploitation of offshore wind and wave energy. In particular, this paper deals with a novel hybrid wind-wave system that integrates an oscillating water column wave energy converter with an offshore wind turbine on a jacket-frame substructure. The main objective of this paper is to characterise the hydrodynamic response of the WEC sub-system of this hybrid energy converter. A 1:50 scale model was tested under regular and irregular waves to characterise the hydrodynamic response of the WEC sub-system. The results from this analysis lead to the proof of
