## When Stakeholder Pressure drives the Circular Economy: Measuring the Mediating Role of Innovation Capabilities

### Abstract

**Purpose:** This paper has explored the impact of stakeholder pressures on firm's circular economy initiatives. The organisational responses are quite heterogeneous even when the firms face similar pressure. We have tried to explain this heterogeneity by using innovative capability as mediating variables.

**Design/methodology/approach:** Empirical survey data from Indian manufacturing firms are obtained and used to test the proposed hypotheses. The hypotheses are grounded in resource-based view of the firm. We used structural equation modelling approach with maximum likelihood methods of approximation.

**Findings:** The results indicate that exploratory innovation positively influences the firms to adopt circular economy practices, whereas, exploitative innovation capability inhibits the adoption of circular economy practices.

**Practical implications:** This study provides some guidelines for business managers to focus on developing exploratory innovative capabilities before the adoption of circular economy practices. It further inform policy makers about the role regulatory mechanism plays to encourage/inhibits firms for adopting circular economy practices.

**Originality/value:** This study is the first to analyze the idiosyncratic behavior of the firms when subjected to stakeholder pressure for circular economy practices adoption. Innovative capabilities (exploratory/exploitative) are able to explain the reason for diverse response to stakeholder response.

## 8 9 **1. Introduction**

10  
11  
12  
13 In recent years, industries are struggling to maintain a balance between their ecological impacts,  
14 people welfare and cost benefits in a value chain context. This drives managers to employ  
15 circular economy (CE) concepts to optimize resources and manage carbon emissions (Winans et  
16 al., 2017; Urbinati et al., 2017). Currently, industries are doing business by using the concepts of  
17 linear economy – make, use and disposal of products. Resource (material) flow is an imperative  
18 concept of value chain that allows manufacturer to produce required products. In management  
19 science, researchers and practitioners submitted linear production model as a mean of resource  
20 wastage in several ways. Considering for example, waste generated during production processes,  
21 end-of-life waste, and excessive use of energy (Michelini et al., 2017).  
22

24  
25  
26  
27  
28  
29  
30  
31  
32

33  
34 In view of growing need of resource depletion rates, industries needs to revolutionise for some  
35 novel economic model - CE facilitates in building a resource efficient and regenerative model by  
36 optimising the resource used and waste generated (Guo et al., 2017; Mangla et al., 2018a). CE  
37 also adds to the economy of both the industry and nation through creating opportunities for  
38 investments and new jobs, optimising materials' cost, stabilising product prices, improving  
39 supply chain resiliency, and reducing ecological impacts (Lieder and Rashid, 2016).  
40  
41  
42  
43  
44  
45  
46

47  
48 On a managerial perception, the preposition of enhancing sustainability of supply network has  
49 become a contemporary issue in operations and supply chain contexts. (Alcalde-Heras et al.,  
50 2018; Brown and Bajada, 2018; Jose Chiappetta Jabbour & Beatriz Lopes de Sousa Jabbour,  
51 2014; Mishra et al., 2018).

53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 CE, a recent buzzword (Ellen MacArthur Foundation, 2012), adds to business sustainability  
4  
5 through innovative models of production and consumption (Lopes de Sousa Jabbour et al., 2018)  
6  
7  
8 The practises of CE and related activities have been widely recognised by management science  
9  
10 professionals; however, the methodical research evaluation of CE is rather unexplored  
11  
12 (Korhonen et al., 2018). In line with this, practicing managers are also finding it difficult to  
13  
14 develop efficient CE based frameworks to support in transforming their linear business models  
15  
16 or build new ones. To help industries, managers may focus on macroloops in CE implementation  
17  
18 to deal with product-life issues, promote remanufacturing, redistribution, reuse and recycling, etc  
19  
20 (Urbinati et al., 2017). Additionally, industries are required to innovate their supply chain  
21  
22 capabilities to adopt such a new concept - CE. In this sense, sustainability focused innovation  
23  
24 capabilities assist industries to improve their ecological efficiency and create market value. In  
25  
26 doing so, industries need to engage with different internal and external stakeholders and initiate  
27  
28 innovative strategies to extract value (Watson et al., 2018). This involvement of different  
29  
30 stakeholders (economic and societal stakeholders) allow them to collaborate and work for  
31  
32 developing and enabling a circular flow of material and resources efficient (Ranta et al., 2018).  
33  
34  
35 Studies considering stakeholder pressure, innovative capabilities and the CE practices as silos  
36  
37 have been published (Lieder and Rashid, 2016; Despeisse et al., 2017; Zeng et al., 2017; Dubey  
38  
39 et al., 2018; Ranta et al., 2018; Watson et al., 2018), but a conceptual and theoretical linkage of  
40  
41 these research literature stream is still needed (Mangla et al., 2018b). This research attempts to  
42  
43 provide a theoretical framework to investigate the relationships between these concepts  
44  
45 (stakeholder pressure, innovative capabilities and the CE practices). This framework's  
46  
47 conceptual relationship investigation will occur within the Indian manufacturing industry context  
48  
49 to help answer the potential questions and test the hypotheses and provide some practical insights  
50

3 and guidelines for managerial implementation. Indian manufacturing sector and supply chains  
4 was targeted for this study due to their recent and future growth phenomena (Mehta and Rajan,  
5 2017). It is one of sectors in India with a growing revenue potential reaching some US\$ 1 trillion  
6 by 2025 (Kusi-Sarpong et al, 2018). Unfortunately, this industrial growth have not match up with  
7 technological advancement and organisational practices in manufacturing processes and  
8 methods; therefore, little investments have been made. There is therefore the need to improve  
9 overall sustainable performance in Indian manufacturing supply chains. One important initiative  
10 to help in achieving this goal is by introducing circularity concept (CE practices) into their  
11 supply chains.

23

24 Stakeholder pressure and innovative capabilities are necessary to create truly CE practices. In  
25 this regard, this paper submits the following research enquiries: What is the theoretical  
26 framework of relationships between stakeholder pressure, innovative capabilities and the CE  
27 practices? How does stakeholder pressure and innovative capabilities affect CE implementation?  
28  
29  
30  
31

32 The contributions of this paper is three-fold. First, it introduces a unified framework that brings  
33 together stakeholder pressure, innovative capabilities and the CE initiatives to very well explain  
34 the conceptual and theoretical linkage among these dimensions for upscaling CE. Second, it  
35 investigates the relationship and impact of stakeholder pressures on firm's circularity within the  
36 India manufacturing sector, providing another perspective of the literature, contributing to the  
37 theory. Third, the focus of this work on India and its manufacturing sector is another contribution  
38 aiding in the building up of studies from emerging economies on this subject.

2  
3 describes the proposed methodology for this research. The data analysis and results are presented  
4  
5 in Section 5. Conclusions along with the policy recommendations are discussed in Section 6.  
6  
7 Finally, Section 6.1 provides limitations and the scope for future research.  
8  
9

## 10 11 12 **2. Literature Review** 13

14 This section reviews and discusses the stakeholder pressure; the concept of CE and sustainable  
15 innovation capability from the literature to propose a theoretical model for this study.  
16  
17

### 18 19 *2.1 Stakeholder Pressure: an overview* 20

21 A stakeholder is define as “any group or individual who can affect or is affected by the  
22 achievement of the organization’s objectives” (Edward, 1984; Liu et al., 2018). From a  
23 managerial context, stakeholders’ participation and engagement are significant avenues, which  
24 are considered as a transactional process to accommodate the preferences of their various  
25 stakeholder groups. Stakeholders may be internal and external to an organisation with both typing  
26 significance roles. In addition, external stakeholders are considered as imperative sources of  
27 innovation that drives managers to explore how firms can echo their competitive strategy with  
28 such transformations (West et al., 2014; Watson et al., 2018).  
29  
30

31 Due to increased awareness and knowledge of stakeholders on sustainability issues, industries  
32 pushes to reconcile the whole life cycle of a product including sourcing, manufacture, use,  
33 disposal and recovering the value of product after its end of life. This call for the need to  
34 integrate organisational value chain capabilities with the stimulating stakeholder issues from a  
35 holistic point (Witjes and Lozano, 2016). Govindan and Hasanagic (2018) reported five types of  
36 stakeholders in their research, which are given as - workforce, customers, shareholders, the  
37 government bodies and NGOs. Derived from literature, stakeholder pressure significantly drives  
38

2  
3 the ecological performance of a business organisation. On a strategic note, managers should  
4 ascertain the level of influence of the stakeholders, as it is very difficult to satisfy each  
5 requirement of stakeholders for higher business profitability. In order to have an effective CE  
6 implementation, managers need to focus equally on stakeholder's criteria along with materials  
7 and technological advancements (Naustdalslid, 2014; Ranta et al., 2018). This distinguish the  
8 role of stakeholders (external and internal) in implementing CE concepts in improving material  
9 recovery capabilities, for accomplishing the sustainable development goals of responsible  
10 consumption and production and industry infrastructure and innovations (Mangla et al., 2018b).

## 21 ***2.2 Circular Economy and Sustainable Innovation Capabilities***

22  
23  
24 There has been a severe concern arisen for societies due to increased environmental problems  
25 and climate change issues during past few years. Societal expectations are also tumbled due to  
26 poor employment, unfriendly working culture, social openness, and the poverty and inequality  
27 issues. Economies (developing or developed) also facing severe problematic issues like supply  
28 disruptions, taxes and incentive structure, market dynamics, volatility in price structure, which  
29 has a major impact on individual firms and whole economies (Jakhar et al., 2018). To manage  
30 aforesaid and sustainability related concerns, CE has been evolved as a recent industrial concept  
31 and gained significant importance in recent years (Geissdoerfer et al., 2017). Ellen MacArthur  
32 Foundation introduced CE in 2012; the idea was to recall the value of products (Butterworth et  
33 al., 2013; Despeisse et al., 2017).

34  
35  
36 The CE could be implemented through various R's concepts: reuse, reduce, and recycle. Reuse  
37 allows managers to minimise the consumptions of resources, energy, and labor, which may  
38 exceed in case of using fresh materials in producing final products. Reduce also allows managers  
39 to upgrade in terms of superior technologies, higher information infrastructure to optimise

1  
2  
3 resources, energy etc. In case of recycling, the used/waste materials are reprocessed for  
4 producing the desired product (Ranta et al., 2018). The CE aims to build an economic system –  
5  
6 which is restorative and generative in nature. That's a system that seeks to maintain the value of  
7  
8 resources to generate economy on a long-term while reducing the generation of waste (European  
9  
10 Commission, 2015; Ranta et al., 2018). The CE has also been addressed as a significant agenda  
11  
12 in the sustainable development goals. Governmental bodies and international markets are advised  
13  
14 to build a circular economy driven ecosystem, which is reflected by treating the environment as a  
15  
16 waste reservoir (Lieder and Rashid, 2016; Zeng et al., 2017).

17  
18 CE helps in transforming the linear production systems (purchase, produce, use and disposal)  
19  
20 into closed systems. Better still, CE presents a circular consumption model for organisations to  
21  
22 optimize resources and conserve energy (Su et al., 2013; Urbinati et al., 2017). The CE based  
23  
24 models have gained considerable attentions throughout the world (developing and developed  
25  
26 economies) to enhance business sustainability (Despeisse et al., 2017; Mangla et al., 2018a).

27  
28 The acceptance of CE will require organisation to develop innovation capabilities such as eco-  
29  
30 innovations. The eco-innovation could also be understood as “the production, application or  
31  
32 exploitation of a good, service, production process, organisational structure, or management or  
33  
34 business method that is novel to the firm or user, and which results, throughout its life cycle, in a  
35  
36 reduction of environmental risk, pollution and the negative impacts of resource use (including  
37  
38 energy use) compared to relevant alternatives” (Kemp and Pearson, 2007). The eco-innovation  
39  
40 initiatives will facilitate firms in closing the loop of product life cycle and recovering the value  
41  
42 of products from waste.

43  
44 Carrillo-Hermosilla et al. (2010) argued that, the significance of sustainable innovation is to  
45  
46 enhance ecological performance while evaluating the environmental impacts of production  
47  
48  
49  
50

1  
2  
3 systems. Sustainability is hinged on innovation and thus, sustainable innovation is central to  
4 achieving sustainability (Kusi-Sarpong et al., 2018). Therefore, CE is the indicator of a business  
5 shift underpinned by the way manufacturer produces, consumers consume and people behaves,  
6 while responding to the ecological and societal needs (Hofstra and Huisingsh, 2014; Prieto-  
7 Sandoval et al., 2018).

12  
13

### 14 15 16 17 **3. Theoretical Underpinning: Resource Based View**

18  
19 Wernerfelt (1984) proposed that resources of an organization combined together in a unique way  
20 can provide sustainable competitive advantage. This resource based view (RBV) of an  
21 organization postulates that resources (physical and intellectual) are accumulated over a long  
22 period of time and are differentially distributed among the firms in the industry (Lavie, 2006).  
23 The resources which are VRIN (Valuable, Rare, Inimitable and Non-substitutable) leads to long  
24 lasting advantage for the firms in the industry (Barney, 1991). Hart (1995) argued that natural  
25 environment is also a key resource and firms should consider the challenges and opportunities  
26 imposed by natural environment.  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36

37  
38 Many studies on environmental performance use the resource-based view (either singly or in  
39 combination with Stakeholder theory (Freeman, 1984) as a launch pad for theorizing. This is  
40 because truly “sustainable” strategies tend to be developed over a long period of time and  
41 possess the properties of VRIN (McGee, 1998). Circular economy practices are the most  
42 advanced practices for environment protection and are developed through unique combinations of  
43 physical and intellectual resources which ultimately is considered to be VRIN (Sarkis et al.,  
44 2010). However, extensive empirical testing has failed to conclusively support that adoption of  
45 circular economy practices always leads to a higher performance and competitive advantage for  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 business organizations. Even when firms are pressured to adopt these practices, they tend to  
4 generate heterogeneous responses (Darnall and Edwards, 2006; Berrone et al., 2013). Does this  
5 mean that the theory is flawed? The answer is “NO.” As argued below, we assert that the basic  
6 theoretical underpinnings of the business case of sustainability are correct, but the key construct  
7 that mediates the transformation of stakeholder demands into implementing circular economy  
8 practices is missing. This may be explained by the lack of capabilities as defined by the RBV.  
9 The capabilities to pursue innovation plays most important role to foster firms to adopt advanced  
10 sustainability practices such as circular economy (Porter and van der Linde, 1995; Jaffe and  
11 Palmer, 1997; King and Lenox, 2002; Brunnermeier and Cohen, 2003; Buysse and Verbeke,  
12 2003; Berrone et al., 2013). A firm’s competitive advantage depends on its ability to innovate in  
13 ways that its rivals cannot easily imitate. Environmental innovation is opined to be a valuable  
14 policy for managers to follow for adoption of circular economy (Berrone et al., 2013). Therefore,  
15 business organizations will try to exploit their distinctive innovative capabilities for adopting  
16 sustainable innovations.

17 Interestingly, both innovation types (i.e., exploratory/exploitative) may not lead to competitive  
18 advantages. The skills and capabilities for exploratory innovation are necessary for survival and  
19 long-term competitiveness (Mueller et al., 2013). Rivals find it difficult to imitate exploratory  
20 innovations. First-mover advantages may last for a comparatively long time, which may increase  
21 the duration of monopolistic advantages and high returns (Benner and Tushman, 2003).  
22 Exploitative innovation however is aimed at creating and commercializing improved or refined  
23 products, services, and business models to meet the needs of existing customers or markets  
24 (Benner and Tushman, 2003).  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Since exploitative innovation is less resource intensive, profitability gains occur only in the short  
4 run (Mueller et al., 2013). Furthermore, exploitative innovation strategy works on continuous-  
5 improvement methods and focus on well-defined objectives. Such a strategy is process intensive,  
6  
7 easy to imitate and duplicate quickly. Based on the above theoretical argument, we posit that the  
8 heterogeneity of a business organization in terms of strategic innovative capabilities can be a  
9  
10 most significant source of variation in organizational response to circular economy demands. We  
11  
12 propose the following hypotheses:  
13  
14  
15  
16  
17  
18

19 **Hypothesis 1:** A firm which has exploitative innovative capabilities, would respond to  
20 stakeholder pressure negatively for adoption of biological circular economy practices.  
21  
22

23  
24 **Hypothesis 2:** A firm which has exploitative innovative capabilities, would respond to  
25 stakeholder pressure negatively for adoption of technical circular economy practices.  
26  
27

28  
29  
30 **Hypothesis 3:** A firm which has exploratory innovative capabilities, would respond to  
31 stakeholder pressure positively for adoption of biological circular economy practices.  
32  
33

34  
35 **Hypothesis 4:** A firm which has exploratory innovative capabilities, would respond to  
36 stakeholder pressure positively for adoption of technical circular economy practices.  
37  
38

#### 39 40 **4. Methodology**

41  
42 We used structural equation modelling approach to empirically test the proposed hypotheses for  
43 circular economy practices adoption. The proposed relation is mediated by the exploratory and  
44 exploitative innovation capabilities (Figure 1). To evaluate mediation, we firstly considered the  
45 direct path and then evaluated the relationship mediated by both innovation capabilities. If the  
46 direct path between stakeholder pressure and circular economy practices becomes insignificant  
47 in the presence of exploratory/exploitative innovative capabilities as mediator constructs then we  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 consider it full mediation. If both paths (direct and via mediator variable) are significant then we  
4  
5 consider partial mediation. Finally, if indirect path is insignificant and direct path is significant  
6  
7 then we consider no mediation.  
8  
9

#### 10 11 12 ***4.1 Instrument development*** 13

14 In order to measure stakeholder pressure, we comparatively analyzed the existing scale from the  
15 literature. After comparative analysis, we choose the scale from Buysse and Verbeke (2003).  
16  
17 There are two reasons for choosing this scale. Firstly, this scale covers most of the key items  
18 present in all other scale. Secondly, the reliability & validity of this scale is already established in  
19 an empirical study of Indian manufacturing organization (Jakhar, 2017). This scale divides the  
20 stakeholder construct into four categories namely: regulatory, external primary, internal primary  
21 and secondary stakeholders. We used five point Likert scale ranging from 'no influence' to 'very  
22 strong influence'.  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32

33 To measure practices for circular economy, we analyzed the relevant scales from extant  
34 literature. Most of the literature on circular economy agrees on the fact that broadly circular  
35 economy practices can be divided into two categories namely: 1. Biological (renewable flow  
36 management) 2. Technical (stock management). We did not find any tested scale in extant  
37 literature in Indian context using empirical study. Therefore, we decided to develop a new scale  
38 and generated a pool of items for measuring circular economy practices. We present this pool to  
39 an expert panel. The panel consists of 4 members from industry dealing with circular economy  
40 issues; 2 academicians actively doing research on circular economy and 2 senior environmental  
41 ministry official dealing with policy issues related to circular economy. The members were  
42 presented with the pool of items individually and asked to add/delete the items if they feel all

59  
60

1  
2  
3 relevant dimensions are not covered. Finally, all the modifications were integrated and presented  
4  
5 to all members of the panel for arriving at a consensus. After several round we were able to  
6  
7 present a scale agreed by all experts. We considered five point Likert scale ranging from “not  
8  
9 considering” to “successfully implemented”.

10  
11  
12 To measure a business organization’s capabilities for pursuing exploratory and exploitative  
13  
14 innovations, we adopted a valid and reliable scale from Jansen et al. (2009). Kortmann *et al.*  
15  
16 (2014) and Rathore et al. (2018) also used this scale to study innovation in Indian manufacturing  
17  
18 organizations. The final scale with all the constructs and their measuring items is presented in  
19  
20 Table 3.  
21  
22

#### 23 24 **4.2 Study Sample**

25  
26 In this study, we considered Indian manufacturing organizations to gather the survey data on  
27  
28 stakeholder influence for circular economy practices adoption mediated by exploratory and  
29  
30 exploitative innovation capabilities. We gathered individual firm level data from senior level  
31  
32 executives directly dealing with issues related to circular economy. Due to high economic  
33  
34 growth and its resultant impact on environmental degradation, the manufacturing organization in  
35  
36 India would be an ideal firm to test the proposed hypotheses on circular economy practices  
37  
38 adoption (Jakhar 2015). We considered firms in various manufacturing industries that employed  
39  
40 100 or more full time employees and firm operates in their respective industry for at least 10  
41  
42 years or so. The reason for this condition is that exploratory innovations sometime lasts for 3 to 5  
43  
44 years and organizations should have completed a couple of projects. For building our sample, we  
45  
46 used the listing of the firms in Bombay stock exchange. We collected a list containing  
47  
48 information about 946 manufacturing firms satisfying the above criteria.  
49

57  
58  
59  
60

1  
2  
3 We followed Dillman's (2000) five-point contact protocol for data collection. We used two  
4 methods of data collection namely: personal visits and online survey. In the recent literature  
5 specifically for empirical studies in operations management similar approach has been applied to  
6 enhance response rate (Shafiq *et al.*, 2014). We received 276 complete responses. An industry  
7 wise classification of the sample is provided in Table 1.  
8

## 17 **5. Results and Discussion**

### 18 **5.1 Measurement Model**

19 We constructed 11 first order construct from 36 items (measurement variable). We tested the  
20 measurement model by examining individual item reliability, internal consistency, and  
21 discriminant validity.  
22  
23  
24  
25  
26

27 **Insert Table 2 Here**  
28  
29

30 In our model item loading values ranged from 0.61 to 0.87 (table 2) and found to be statistically  
31 significant ( $p < 0.01$ ). It indicates that the amount of variance of an items is significantly  
32 explained by underlying construct rather than error due to measurement. Therefore, item  
33 reliability is established in our model.  
34  
35  
36  
37  
38

39 We used three test to establish the internal consistency for each latent construct in our  
40 measurement model. First, the Cronbach alpha value ranged from 0.75 to 0.91 (table 3) which is  
41 higher than the threshold value 0.7. We calculated *composite reliability* by using the formula  
42 provided by Fornell and Larcker (1981) using the input data as standardized loading and  
43 measurement error of the measurement scale. The composite reliability value ranged from 0.87  
44 to 0.92 (see table 3) and sufficiently above the considered threshold value of 0.7. Finally, we  
45 calculated the average variance extracted by using the formula provided by Nunnally and  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Bernstein (1994). As given in table 3, the calculated values of the average variance extracted  
4 ranged from 0.69 to 0.78 and exceeded the threshold value of 0.50. All three test establishes the  
5  
6 convergent validity of the measurement model.  
7  
8  
9

10  
11  
12 To establish discriminant validity, the squared correlation value between constructs must be  
13 smaller than the square root of average variance extracted of each construct. Table 4 shows the  
14 correlations between latent variables with square root of average variance extracted (SQRT  
15 AVE) in the diagonal. As can be seen from the table that squared correlation values are  
16 sufficiently lower than the SQRT AVE and established that conceptually similar concepts are  
17 distinct.  
18  
19  
20  
21  
22  
23  
24

**Insert Table 4 Here**

25  
26  
27  
28 Since the survey data were collected from single respondent from every firm, it may cause  
29 common-method variance and thus systematic measurement error. To evaluate common-method  
30 bias within the data, Harmon's single factor test was conducted (Podsakoff et al., 2003). No  
31 single factor emerged from factor analysis which could explain reasonably significant share of  
32 variance among measurement items therefore an inference can be drawn that common method  
33 variance is not present.  
34  
35  
36  
37  
38  
39  
40  
41

42 After establishing the reliability and validity of measurement scale, we tested the proposed  
43 hypotheses in structural model as discussed below.  
44  
45

### 46 ***5.2 Structural Model***

47  
48  
49 Figure 1 shows the proposed relationships of the structural model. The data were analyzed using  
50 the statistical package AMOS 20 by using the maximum likelihood estimation method. We  
51 tested the model fit by using a diverse set of model fit indices (we considered a mix of absolute,  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 parsimonious & noncentrality-based fit indices). Table 5 shows the Goodness-of-fit indices for  
4 the structural model.  $\chi^2/df$  value turn out to be 1.97 (which is sufficiently lower than the  
5 suggested value <3). Similarly, other values are also satisfying the recommended criteria, and  
6 these recommends that the proposed structural model fits well to the collected.  
7

9  
10  
11  
12  
13

### 14 5.2.1 Testing of the Hypotheses

15  
16  
17 Table 6 presents the structural model paths results. The path coefficient between all stakeholders'  
18 constructs and exploitative innovation is positive and statistically significant ( $\beta$  value ranged  
19 from 0.34 to 0.41 with all  $p < 0.01$ ). The path coefficients between three stakeholders' (except  
20 regulatory) and exploratory innovation is also positive and statistically significant ( $\beta$  value  
21 ranged from 0.45 to 0.51 with all  $p < 0.01$ ). However, the path coefficient between regulatory  
22 stakeholder and exploratory innovation is negative and statistically significant ( $\beta = -0.45$ ,  
23  $p < 0.01$ ). Which indicates that all stakeholders positively influence the Indian manufacturing  
24 firms to adopt exploitative innovative practices. The same is the case for exploratory innovative  
25 practices the only deviation is with regards to the relationship between regulatory stakeholder  
26 and exploratory innovative practices. The regulatory stakeholders in India negatively influence  
27 the exploratory innovative practices.  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41

42 **Insert Table 6 Here**

43  
44  
45  
46  
47 The path between exploitive innovation capabilities and circular economy practices (both  
48 Biological & Technical) is negative and statistically significant ( $\beta$  value ranged from -0.39 to -  
49 0.47 with all  $p < 0.01$ ). This indicates that the firms with higher and higher exploitative innovative  
50 capabilities will tend to adopt lesser and lesser circular economy practices. Moreover, in the  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 presence of exploitative innovation construct as mediator construct the direct relationship  
4 between all stakeholder pressure groups and circular economy practices is statistically  
5 insignificant ( $\beta$  value ranged from 0.06 to 0.20 with all  $p \geq 0.07$ ). These results show strong  
6  
7 evidence of complete mediation of the relationship between stakeholder pressures and the  
8 adoption of circular economy practices (both Biological & Technical), by mediator exploitative  
9 innovation. Thus, Hypotheses 1&2 are strongly supported.

10  
11 The path coefficients between explorative innovation capabilities and circular economy practices  
12 (both Biological & Technical) is positive and statistically significant ( $\beta$  value ranged from 0.53  
13 to 0.58 with all  $p < 0.01$ ). Moreover, in the presence of explorative innovation capabilities as  
14 mediator variable the direct path between stakeholder pressure group and circular economy  
15 practices becomes statistically insignificant. These result establishes the complete mediation of  
16 explorative innovation capabilities for the relationship between stakeholders of Indian  
17 manufacturing firms and adoption of circular economy practices. There hypotheses 3 & 4 are  
18 also fully supported.

## 37 **6. Conclusions and country implications**

38  
39 There exists a broader consensus in extant literature that various stakeholder groups do influence  
40 the manufacturing firms to adopt circular economy practices. However, different firms under  
41 similar stakeholder groups adopts diverse circular economy practices. In this paper we attempted  
42 to resolve this larger puzzle that “why firms adopt diverse circular economy practices despite  
43 being subject to similar stakeholders’ pressure”. Here we posit that innovative capabilities  
44 developed over time plays a key role in guiding firms to adopt the circular economy practices. In  
45 the literature, the innovative capabilities are divided into two categories namely: exploitative and  
46  
47  
48  
49  
50  
51  
52

55  
56  
57  
58  
59  
60

1  
2  
3 exploratory innovative capabilities. Our results show that exploratory innovative capabilities  
4 only positively influence firms to response to various stakeholder pressure. However, regulatory  
5 stakeholder also negatively influence both exploitative innovative capabilities as well as circular  
6 economy practice (both Biological & Technical). The reason for the same may be explained by  
7 the regulatory mechanism followed in India. The command & control regulatory mechanism is  
8 used for circular economy practices adoption in India. In this type of mechanism, the  
9 manufacturing firms are allocated an upper emission cap in three-year block. Firms are required  
10 to submit their emission level in prescribed Performa. If any firms emit less that limit than no  
11 incentive is attached to it. However, if a firms emits more than the limit than a penalty is attached  
12 with lowering its emission quota for subsequent years. Here we propose that the reason for  
13 negative influence may lies in this regulatory mechanism and its implementation process. First,  
14 no incentive attached if firms emits less (no monetary incentive such as tax holidays and no carry  
15 forward). Furthermore, a great emphasis is placed on bureaucratic reporting process rather than  
16 actual reduction. Firms can easily get away by tweaking the process. Moreover, no incentive to  
17 invest resource in reduction beyond limit. As opposite to this, European Union follows market  
18 based regulatory mechanism where firms have incentive to adopt circular economy practices as  
19 much as possible to reduce environmental damage. In this mechanism, if a firm reduce emission  
20 beyond its allocated quota the surplus credit can be sold in the credit market. Firms which emit  
21 more should buy those excess emission credits in the market. Here we propose that India policy  
22 maker should think to shift from command and control mechanism to market based mechanism  
23 to positively influence firms to adopt circular economy practices.

### 24 ***6.1 Firm and Managerial implications***

57  
58  
59  
60

1  
2  
3 The exploratory innovative practices work as complementary capabilities for circular economy  
4 practices adoption. As we look very closely to circular economy practices they require  
5 significant changes to products and processes. For example, business redefinition requires firms  
6 to make drastic changes to develop new products for bottom of the pyramid. These practices  
7 require unique set of capabilities with are valuable, rare, inimitable and non-substitutable. For  
8 firms with exploratory innovative capabilities it becomes easier for them to adopt these circular  
9 economy practices for sustainable competitive advantages. Moreover, for firms with exploitative  
10 innovative capabilities they try to implore their existing process and capabilities and opposite to  
11 the needs of circular economy practices. Furthermore, firms may also come into inertia and  
12 develop resistant to change. However, firms with exploratory innovation capabilities are tuned to  
13 adopt rapid changes.

14  
15 From a managerial perspective, managers may encourage at an organizational/operational level  
16 the adoption of the most influential and well connected variables that may impact greatly and  
17 cause other variables to change leading to an increased overall performance outcome. Managers  
18 can also focus and invest resources on the “less connected, less reinforced and more immature”  
19 variables as the well-connected variables may have already been implemented and hence  
20 developed or mature, and that may explain the reasons for the relative causation/connectivity.

## 21 ***6.2 Future Research Directions***

22 In this paper we considered cross sectional data obtained using empirical survey method from  
23 Indian manufacturing organizations. An industry specific study may reveal deeper understanding  
24 of the inherent intricacies of particular industry. Moreover, survey data can be combined with  
25 secondary data (such as content analysis of reports) to strengthen the reliability and validity of

Table 2. Results of Measurement Model

Table 1 Description of the sample		
4 Digit SIC Code	Description	Number of responses in stage (%)
1000	Metal Mining	11(3.99)
1311	Crude Petroleum & Natural Gas	9(3.26)
2200	Textile Mill Products	23(8.33)
2300	Apparel & Other Finished Prods of Fabrics & Similar Matl	16(5.8)
2400	Lumber & Wood Products (No Furniture)	14(5.07)
2510	Household Furniture	17(6.16)
2600	Papers & Allied Products	15(5.43)
2800	Chemicals & Allied Products	10(3.62)
2851	Paints, Varnishes, Lacquers, Enamels & Allied Prods	14(5.07)
3011	Tires & Inner Tubes	11(3.99)
3100	Leather & Leather Products	14(5.07)
3220	Glass & Glassware, Pressed or Blown	12(4.35)
3241	Cement, Hydraulic	15(5.43)
3310	Steel Works, Blast Furnaces & Rolling & Finishing Mills	21(7.61)
3452	Bolts, Nuts, Screws, Rivets & Washers	12(4.35)
3510	Engines & Turbines	8(2.9)
3620	Electrical Industrial Apparatus	16(5.8)
3711	Motor Vehicles & Passenger Car Bodies	18(6.52)
3713	Truck & Bus Bodies	11(3.99)
4011	Railroads, Line-Haul Operating	9(3.26)
Total Responses		276
Response Rate % (of total 946 firms)		29

Measurement paths	Unstandardized regression weight	Standard error	Critical ratio	Standardised regression weight*	Item reliability
<i>External primary stakeholders</i>					
→Local Customer	1.00	fixed		0.88	0.72
→Offshore customers	1.48	0.09	10.62	0.76	0.66
→Local suppliers	1.32	0.14	9.20	0.68	0.61
→Offshore suppliers	1.37	0.11	10.24	0.73	0.64
<i>Secondary stakeholders</i>					
→Local rivals	1.00	fixed		0.89	0.84
→International rivals	1.14	0.21	8.84	0.78	0.71
→International treaties	1.22	0.18	10.40	0.84	0.82
→NGOs	1.38	0.10	13.68	0.86	0.78
→ Press & Social Media	1.26	0.15	11.78	0.88	0.76
<i>Internal primary stakeholders</i>					
→Employees	1.00	fixed		0.77	0.66
→Shareholders	1.52	0.06	14.57	0.91	0.82
→Financial Institutions	1.46	0.12	13.48	0.86	0.74
<i>Regulatory stakeholders</i>					
→Domestic (and regional) governments	1.00	fixed		0.89	0.75
→Domestic public agencies	1.28	0.17	11.42	0.85	0.69
<i>Regeneration</i>					
→Extraction of biochemical feedstock	1.00	fixed		0.77	0.68
→ Farming/collection	1.32	0.13	8.64	0.80	0.71
<i>Renewable Energy</i>					
→ Biogas generation	1.00	fixed		0.90	0.87
→Use of wind and solar system	1.25	0.14	10.23	0.85	0.79
→Renewables flow management	1.41	0.09	13.24	0.88	0.81
<i>Eco Design</i>					
→ Product & process life cycle analysis	1.00	fixed		0.92	0.82
→ Product durability and recyclability	1.38	0.16	12.43	0.87	0.77
→ Design for easy disassembly	1.22	0.12	9.86	0.85	0.73
<i>Recirculation</i>					
→Reuse/Redistribute products	1.00	fixed		0.78	0.68
→Refurbish/ Remanufacture	1.33	0.14	10.87	0.72	0.65
→Recycle product	1.28	0.19	9.76	0.69	0.61
<i>Business redefinition</i>					
→ Developing products for zero environmental impact	1.00	fixed		0.86	0.72
→Environment as a key driver for business growth	1.12	0.21	11.24	0.71	0.63
→Designing products for bottom of the pyramid	1.30	0.15	9.84	0.78	0.69
<i>Exploratory innovation</i>					
→Our organization accepts	1.00	fixed		0.78	0.68

demands that go beyond existing products and services					
→We commercialize products and services that are completely new to our organization	1.26	0.21	8.84	0.73	0.61
→We frequently utilize new opportunities in new markets	1.34	0.18	10.27	0.81	0.67
→Our organization regularly uses new distribution channels	1.41	0.15	12.54	0.89	0.70
<i>Exploitative innovation</i>					
→We frequently make small adjustments to our existing products and services	1.00	fixed		0.79	0.71
→We improve our provision's efficiency of products and services	1.45	0.09	13.64	0.92	0.85
→We increase economies of scales in existing markets	1.38	0.12	12.54	0.83	0.75
→Our organization expands services for existing clients	1.41	0.11	10.27	0.86	0.77
* Statistically significant at $p < 0.01$ .					

Table 3. Psychometric property of first order measurement scales.

S. No	Latent Variables	Mean	Variance	Number of items	Cronbach's alpha	Composite reliability	Average variance extracted
1	External primary stakeholders	0.58	0.06	4	0.75	0.91	0.75
2	Secondary stakeholders	0.62	0.09	5	0.81	0.89	0.71
3	Internal primary stakeholders	0.67	0.11	3	0.79	0.87	0.69
4	Regulatory stakeholders	0.71	0.14	2	0.91	0.92	0.78
5	Regeneration	0.63	0.10	2	0.85	0.87	0.71

Indices	Measures	Model value	Recommended Value
Chi-Square ( $\chi^2$ )	evaluates overall model fit, the magnitude of discrepancy between the sample and fitted covariance matrices.	1062	---
Degree of Freedom (df)	The total number of observations {available - used to estimate parameters}.	540	---
$\chi^2/df$	Adjusts for sample size.	1.97	<3
Goodness of Fit Indices (GFI)	The proportion of variance accounted for by the estimated population covariance.	0.91	>0.8
Root Mean Square Error of Approximation (RMSEA)	Absolute measure of fit, based on the non-centrality parameter.	0.048	<0.10
Comparative Fit Index (CFI)	Incremental measure, based on the non-centrality measure.	0.93	>0.9
Incremental Fit Index (IFI)	Relative fit index, analogous to $R^2$ .	0.93	>0.9
