**Sonic affects and the production of space: 'Music by handle'  
and the politics of Street Music in Victorian London**

Journal:	<i>cultural geographies</i>
Manuscript ID	CGJ-15-0093.R1
Manuscript Type:	Article
Keywords:	Affect, Music, Noise, Street Music, Sound
Abstract:	<p>This paper examines the affective capacities of sound and its role in the on-going production of social spaces. More specifically, the paper seeks to understand the situated nature of sound's affectivity within particular social-political-material contexts or circumstances. This is developed through a discussion of an empirical case study related to the history of street music: the 'street music debates' of Victorian London. The interrelation here of the sounds street musicians made, the broader urban soundscape of the time, who played street music, and who it was that found themselves listening to this music, demonstrates clearly the situated affective capacities of street music. From this the paper advocates an understanding of the role of sound in the on-going production of social spaces based upon a reciprocal mediation between 'macropolitical' matters related to identity and other social formations and the 'micropolitics' of the affects that such sound and music bring to bear for those exposed to it.</p>

8 **Abstract**  
9

10 This paper examines the affective capacities of sound and its role in the on-going  
11 production of social spaces. More specifically, the paper seeks to understand the situated  
12 nature of sound's affectivity within particular social-political-material contexts or  
13 circumstances. This is developed through a discussion of an empirical case study related  
14 to the history of street music: the 'street music debates' of Victorian London. The  
15 interrelation here of the sounds street musicians made, the broader urban soundscape of  
16 the time, who played street music, and who it was that found themselves listening to this  
17 music, demonstrates clearly the situated affective capacities of street music. From this the  
18 paper advocates an understanding of the role of sound in the on-going production of  
19 social spaces based upon a reciprocal mediation between 'macropolitical' matters related  
20 to identity and other social formations and the 'micropolitics' of the affects that such  
21 sound and music bring to bear for those exposed to it.

34 **1. Introduction**  
35

36 This paper examines the affectivity of sound and its role in the on-going production of  
37 social spaces. Despite a longstanding interest in geography in both sound and music,  
38 Revill has suggested recently that there has been a lack of engagement with the  
39 "processes and practices by which sound actually makes space".<sup>1</sup> Or as Bonn puts it,  
40 such work has been "less attuned to the ways in which music and sound can engender  
41 socialities and spatialities that are irreducible to, if crossed by, ...prior [socio-spatial]  
42 relations – to music and sound as *initiatory* of socio-spatial relations".<sup>2</sup> In exploring such  
43 generative or transformative capacities of sound and its role in the on-going production  
44 of social spaces, this paper seeks to understand the situated nature of sound's affectivity  
45 within particular social-political-material contexts or circumstances.<sup>3</sup> It is frequently  
46 noted that sound holds an elusive and diffuse character.<sup>4</sup> While it may have a specific  
47 source, sound spreads through physical space, it permeates, it is hard to pin down. This  
48 'ubiquity effect' often makes it difficult to identify the source of a sound.<sup>5</sup> Sounds, and at  
49 times their sources, are not always straightforwardly objects and so cannot necessarily be  
50  
51

54  
55  
56  
57  
58  
59  
60

1  
2  
3 easily located in extension. At the same time, though, sound happens as an event within a  
4 specific locality. While its boundaries may be hard to draw, both in terms of its spatial  
5 distribution but also on the grounds of its variable perceptibility to different bodies,  
6 sound takes place somewhere, at some time, and at certain (in)audible frequencies. It is  
7 relational.<sup>6</sup>

8  
9  
10  
11 In thinking about the affectivity of sound and its role in the on-going production  
12 of social spaces this paper will draw on and work through an empirical case study related  
13 to the history of street music: the ‘street music debates’ of Victorian London. Focusing  
14 on street music draws attention to some important facets of the situated affective  
15 capacities of sound that can have a bearing on its role in the on-going production of  
16 social spaces.<sup>7</sup> Street music happens within a specific social setting – the street – that  
17 clearly unfolds prior to and/or in the absence of the happening of such music. It is not  
18 that the sound of street music enters into a neutral vacuum and then miraculates a social  
19 space from that.<sup>8</sup> The spaces such sounds takes place within or intervene into are rarely  
20 a-social or a-historical. Rather such sound’s taking place, and so its affectivity, both  
21 mediates and is mediated by: the specific site in which the sound happens and is  
22 experienced; the multiple body-subjects that produce and hear that sound; the social  
23 relations that exist or are enacted between these bodies; and, the temporality of the  
24 social-sonic event, which unfolds across various durations.<sup>9</sup> Or specifically in terms of  
25 street music, it is not that the street is silent and then becomes an ‘acoustic territory’ only  
26 in street music’s taking place.<sup>10</sup> Rather, street music enters into and becomes a part of a  
27 perpetually unfolding social and sonic scene. The reception of that music, and so its  
28 affectivity, not only comes from the music itself or who plays it but also from the setting  
29 in which it takes place.<sup>11</sup> The sounds of music here are received differently at different  
30 times of day or week or year. It is also received differently in different places by different  
31 bodies depending on, for example, the ‘tone’<sup>12</sup> of the existing/emergent social-spatial  
32 situation. The ‘angle of arrival’<sup>13</sup> of listening bodies into that space, and so how they are  
33 disposed towards hearing those sounds, is also significant to the reception of such street  
34 music.

49  
50 In pursuing this, the remainder of the paper will unfold as follows. Firstly, further  
51 contextualization within academic literatures in and beyond cultural geography on sound,  
52 affect, and noise will be provided and an understanding of the situated nature of sound’s  
53 affectivity developed. From there the paper discusses the sources drawn upon here in  
54 discussing the history of street music. Next, the paper sets the ‘sonic scene’ upon which  
55  
56  
57  
58  
59  
60

1  
2  
3 the 'street music debates' played out and provides some background to their emergence.  
4 The remaining three main sections focus on the co-implication of sound, its affects, and  
5 the context in and through which it was experienced in the case of the street music  
6 debates. These focus on: 1) how tensions around national identity and the rights to the  
7 use of public space amplified street music's disruptive affects; 2) class, taste and how  
8 street music came to be condemned as noise; and, 3) the embodied experience and  
9 'nervous agitation' brought about by street music. The conclusion reflects on the role of  
10 sound in the production of social space in terms of the reciprocal mediation between  
11 such 'macropolitical' matters related to identity and other social formations and the  
12 'micropolitics' of the affects that such sound and music brought to bear. Or in Protevi's  
13 terms, "the imbrications of the social and the somatic" which recognizes "how our  
14 bodies, minds, and social settings are intricately and intimately linked".<sup>14</sup>

## 24 **2. Sounds, noise, and affects**

25 Cultural geography has been interested in sound and music for some time. For example,  
26 early work here examined the relationships between folk music and specific regions, and  
27 considered how music as a cultural artifact was transmitted via oral traditions and the  
28 movements of people across space.<sup>15</sup> Equally, work has been done on the sonic character  
29 of specific environments in the development of understandings of specific regional  
30 soundscapes.<sup>16</sup> Such themes have been developed in research which has thought about  
31 music as a form of meaning-filled 'text' that plays an important role in the formation of  
32 identities, belongings, and so relationships with places.<sup>17</sup>  
33  
34  
35  
36  
37  
38

39 Over the past 10 years or so the epistemological range of work interested in  
40 sound and music has widened further. In particular, cultural geographers have become  
41 interested in what sound and music *do*.<sup>18</sup> Sound and music's capacity to affect the listener  
42 at an embodied level have been considered in terms of the role listening to music can  
43 play in shaping everyday experiences of domestic spaces<sup>19</sup>, as well as more eventful  
44 spaces.<sup>20</sup> Further, the practicing of music itself – as opposed to just the 'product' – has  
45 been considered in terms of how the performance of music can produce specific space-  
46 times of experience and interaction.<sup>21</sup> As Morton suggests, the performance of music can  
47 produce "spaces of the now" that transform social situations and "constitute a sense of  
48 belonging and understanding for many people who participate in their making".<sup>22</sup> Such a  
49 practice-based approach has not solely focused on music, though. It has also translated  
50 into work on sound and soundscapes. Such work has, for example, considered the  
51  
52  
53

2  
3 affectivity of specific (potentially designed or orchestrated) soundscapes.<sup>23</sup> This has been  
4 both in terms of the embodied experience of sound in the immediate present<sup>24</sup> and how  
5 sounds can produce particular embodied relationships with the past.<sup>25</sup>  
6  
7

8 Such practiced-focused research on sound and music has also come to  
9 understand sound through quite specific spatial imaginaries. As Feigenbaum and  
10 Kanngieser note: “Sound creates *atmospheres* through its pitches, tones, volumes,  
11 frequencies and rhythms, which penetrate and travel through material and immaterial  
12 matter across distances, filling spaces within and between bodies”.<sup>26</sup> Geographers here  
13 have begun to examine how sound surrounds listening bodies in occupying a voluminous  
14 spatiality, which in turn can shape the ways in which spaces are experienced.<sup>27</sup> This may  
15 be obvious at times. A loud sound, for example, might draw the attention of the listener  
16 and inflect the tone or feel of that space. Such sound comes to pervasively surround the  
17 listening/experiencing body meaning that it is often “tactilely felt as much as it is heard”.

60  
28 Again, though, geographers have also been attentive to how sound as a background  
phenomena (perhaps the sound of music bleeding out from headphones) can equally be  
“forceful and affect the ways in which we inhabit...space”.<sup>29</sup>

Geographers have not been alone in thinking through such enveloping affective  
spatialities and capacities of sound and music.<sup>30</sup> There is now a growing ‘Sound Studies’  
literature that considers the affective potential of sound and how “sound has an integral  
role in shaping the affective contours of our day-to-day lives”.<sup>31</sup> In thinking through this,  
there are parallels in the sorts of spatiality attributed to sound. As Dyson notes, “Sound  
is the immersive medium par excellence. Three dimensional, interactive, and synaesthetic,  
perceived in the here and now of an embodied space, sound returns to the listener the  
very same qualities that media mediates: that feeling of being here now, of experiencing  
oneself as engulfed, enveloped, enmeshed, in short, immersed in an environment”.<sup>32</sup>

As well as such an emphasis on the individual body experiencing sound as  
affective through this immersion, such Sound Studies literature has also connected this  
to collective experiences and affects.<sup>33</sup> This has led to the exploration of, for example,  
“how sound conditions and contours subjectivity by lending a dynamic materiality for  
*social negotiation*”.<sup>34</sup> Such work has sought to show how sound is “intrinsically and  
unignorablely relational: it emanates, propagates, communicates, vibrates, and agitates; it  
leaves a body and enters others; it binds and unhinges, harmonizes and traumatizes, it  
sends the body mobbing, the mind dreaming, the air oscillating”.<sup>35</sup> The public and  
private come to be nested in and through these relations.<sup>36</sup> Emphasizing such

1  
2  
3 characteristics of sound draws attention to how sound (and its experience) often plays  
4 out at a social/intersubjective level and produces collective affects felt between bodies.  
5 Sounds take place within or provide conditions for social exchanges in various spaces  
6 that bring with them their own specific auditory or acoustic politics.<sup>37</sup>  
7  
8

9  
10 In some cases such social exchanges can be very positive and create what Bonn  
11 calls “aggregations of the affected”.<sup>38</sup> Echoing Morton, Labelle claims “Sound operates  
12 by forming links, groupings, and conjunctions that accentuate individual identity as a  
13 relational project. The flows of surrounding sonority can be heard to weave an individual  
14 into a large social fabric, filling relations with local sound, sonic culture, auditory  
15 memories, and the noises that move between, contributing to the making of shared  
16 spaces”.<sup>39</sup> This can lead to the production of convivial forms of social space. However,  
17 such affective relations can have a negative inflection in acting to ‘disaggregate’ through  
18 affect. The distinction or boundary between sound and noise is relational, simultaneously  
19 a product of a social-spatial context and a physiological affect.<sup>40</sup> Perhaps the most  
20 extreme examples of such a negative politics of sound affects come in the various forms  
21 of ‘sonic warfare’ described by Goodman.<sup>41</sup> It is important to remember, though, that  
22 such a negative politics of sound-affects also plays out in quite banal situations. As  
23 Labelle notes, the background sonic geography of the city can often be disruptive. This is  
24 demonstrated through, for example, noise abatement legislation and related endeavors to  
25 control and shape urban soundscapes by limiting sound’s more easily measurable  
26 qualities – its volumes, temporalities, and so on – and through that its negative affects.<sup>42</sup>  
27  
28

29  
30 Such developments in thinking about what sound and music do help us  
31 understand how sound functions in the world, how it comes to be experienced by those  
32 inhabiting specific spaces, and so ultimately its contribution to the on-going production  
33 of (un)convivial or (unin)habitable social spaces. It is important, therefore, to consider  
34 not just the sound itself that is produced when it comes to sound’s affective capacities.  
35 Rather, the “socio-material processes and practices”<sup>43</sup> and contexts that sounds happens  
36 through, enters in relation with, and/or intervenes into also need to be taken into  
37 consideration. To help think through such an embodied and situated conception of  
38 sound, Bonn suggests that the taking place of sound and music can be understood  
39 through four interrelating ‘planes’ of social mediation. Firstly, there are the “social and  
40 corporeal interactions and intersubjectivities set in motion” between those who produce  
41 and hear these sounds. Secondly, there are the imagined communities or virtual  
42 collectives that come to identify around these sounds. Third, there are the stratified and  
43  
44  
45  
46  
47  
48  
49  
50

55  
56  
57  
58  
59  
60

1  
2  
3 hierarchical social formations that “traverse and refract” such sounds (for example, class,  
4 age, gender, race, and so on). Finally, there are the institutional formations that enable  
5 the production, reproduction, transformation, and I would add, silencing, of these  
6 sounds.<sup>44</sup> It becomes clear then that ‘macropolitical’ concerns over individual or  
7 collective identity, for example, can play a part in the micro-scale affective modulations  
8 that such music might bring about in the listening body. Who is playing the music, who it  
9 is that hears the music, what the music might mean to either party or group, what sounds  
10 are deemed socially acceptable at that time and in that place, amongst other things, can  
11 mediate the embodied reception of that music and so play a part in shaping the unfolding  
12 of social life in that space. The social and the somatic are not two separate and distinct  
13 registers of experience and should not be accorded any sort of *a priori* status over each  
14 other. Rather, “every politics is simultaneously a *macropolitics* and a *micropolitics*” as the  
15 macro and the micro function together, filter or mediating one another iteratively,  
16 “coexist and cross over into each other”, both amplifying and suppressing the affective  
17 capacities of sound.<sup>45</sup>

18  
19 In this, then, sounds both come to mean things – both in the moment and in  
20 light of their social history – and do things – again, both in the moment and based on the  
21 history and context of the body that hears it. And in many cases this hearing is collective  
22 given sound’s pervasive and immersive character – it can envelop individuals *and*  
23 populations, and so shape how spaces are felt and contribute to their ‘tone’ as well as  
24 how bodies feel. It is important, to recognize the co-implication of such facets of sound  
25 in their social-spatial-affective specificity. Sound is done somewhere, at some time. It  
26 enters into and is mediated by a specific social-spatial context in light of something that  
27 has gone before, and is projected towards an uncertain outcome. This is, in turn,  
28 experienced in different ways by different people and/or collectives and, in that, figures  
29 in the on-going production of social spaces. To ground these points around the  
30 contextual-circumstantial nature of sonic affects and show this specificity in terms of  
31 their role in the on-going production of social spaces, the paper will now turn to the  
32 example of street music.

### 3. Writing about the history of street music

33  
34 Writing about the history of street music and its roles in the on-going production of  
35 social spaces poses some challenges. Street musicians have been a near ubiquitous feature  
36 of the everyday life of many urban environments for centuries.<sup>46</sup> However, such  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46

57  
58  
59  
60

1  
2  
3 performers have commonly maintained marginal positions within those societies/spaces.  
4 For example, during the Middle Ages “Minstrels...were thought of as lecherous and  
5 irresponsible fly-by-nights”<sup>47</sup> and associations between such performers and vagrancy  
6 recur through the history of street music. This has implications for both the reception of  
7 their music and the range and nature of the documentation of the history of these  
8 performers and their music. Historical records of street music and the musicians that  
9 played it are quite limited. In the exceptional cases where records are present, there are  
10 also some limitations to those sources in that they often provided partial<sup>48</sup> or overly  
11 negative accounts of street music and the musicians that played it. This actually means  
12 that, as Sally Harrison-Pepper notes, “Much of the history of street performance...is  
13 found in the laws that prohibit it”<sup>49</sup>. It is quite hard, therefore, to access a full and  
14 balanced account of the affecting/affective relationships between street music, its  
15 audiences, and the spaces it took place within.

16  
17  
18  
19  
20  
21  
22  
23  
24 With this in mind, this paper focuses on one particularly well-documented  
25 episode in this history of street music: the situation of street music in Victorian London.  
26 This case demonstrates quite clearly the role of street music in the on-going production  
27 of social spaces. The ‘street music problem’, as it was then called, emerged in light of the  
28 growing class of musical, medical, legal, and literary professionals – individuals with  
29 means and opportunities to voice their concerns, if not to escape them – for whom street  
30 music disrupted the quiet tenor of their home-working lives. This has left a range of  
31 interesting written sources grouped around the mid-19<sup>th</sup> Century. These have been  
32 shown in a number of commentaries to give an insight into the contentious situation of  
33 street musicians in the streets and squares of London at that time.<sup>50</sup>

34

58  
59  
60  
In considering the street music problem this paper re-reads a range of sources  
from this time with the aim of better delineating the varied and situated affective  
capacities of such street music. One such key source re-examined here is *Street Music in the  
Metropolis*.<sup>51</sup> This was published by Michael T. Bass, a brewer from Burton and MP for  
Derby from 1848 until 1883<sup>52</sup>. In this, Bass collated letters he had been sent, official  
reports, materials from the press, and so on, and published the text specifically to  
coincide with debates over changes he had proposed to Parliament around the regulation  
of street music in the metropolis (see Section 4). The text itself is notable for the range of  
significant names that appear in it and for the way in which it clearly shows the distaste  
for street music held by one section of the public and its impact on how they  
experienced both public and private spaces in the metropolis. A further key source re-

1  
2  
3 examined here is Charles Babbage's 'Chapter on Street Nuisances' from his  
4 autobiography *Passage in the Life of a Philosopher*.<sup>53</sup> The very fact that this well-known  
5 philosopher and mathematician devoted an entire chapter of his autobiography to this  
6 topic gives a sense of the potential significance he felt street music had to his  
7 professional activities. Finally, notable here also is the availability of sources from the  
8 time that provide comments from the performers themselves. In particular, Volume 3 of  
9 Henry Mayhew's *London Labour and the London Poor* includes reports from interviews with  
10 a range of street performers working in the metropolis around the time of the street  
11 music debates.<sup>54</sup>

12  
13 In addition to re-reading these relatively well know sources, this paper also draws  
14 on supplementary original archival research. In particular, materials collected together on  
15 the VictorianLondon.org website<sup>55</sup> and other occasional texts from period newspapers  
16 are discussed to further understand the relationship between street music, its audiences,  
17 and the social spaces it was heard within and whose character it contributed to.

18  
19 The paper will look to these sources, and the 'street music debates' generally, as  
20 an entry point into understanding a particular set of effects, perhaps best captured by a  
21 particular 'name of history'<sup>56</sup>: the 'Babbage effect', that took place in the production of  
22 social spaces at this time. These sources do not directly allow for the experiencing of the  
23 soundscapes of this time<sup>57</sup> or the description of how such music's affects were *actually*  
24 felt.<sup>58</sup> That said, they do provide a range of evocative, detailed, and charged *descriptions* of  
25 the affects this music brought about. These were often couched in terms of negative  
26 affects on the listeners' 'nerves' but also their 'capacities' to work and where articulated  
27 in relation to various social concerns of the time. A clear sense of the embodied impact  
28 of such music upon certain sections of the metropolis's population, the intensity of the  
29 distaste and disruption this produced, how this came to be mediated through various  
30 politics of individual and collective identity and legislative provisions, and so the sorts of  
31 unconvivial and/or inhospitable atmospheres within these social spaces that were  
32 produced as a result, come through in these impassioned accounts. Such historical-  
33 textual sources, then, present "active and affective interventions" that bare witness to  
34 past affects, shifts in nervous tensions and energies brought about by certain sounds, and  
35 so provide insights into the history of the relationships between street music and the  
36 social spaces of the Victorian Metropolis.<sup>59</sup>

4. Street music and the Victorian soundscape

1  
2  
3 The 18<sup>th</sup> and 19<sup>th</sup> Centuries saw dramatic changes in the soundscapes of the United  
4 Kingdom.<sup>60</sup> The Industrial Revolution in particular led to significant changes in the  
5 soundscapes of urban environments. This had major implications in transforming what  
6 was heard and how this was listened to.<sup>61</sup> For example, the increased necessity for  
7 factory-based work drew large numbers of people into urban areas and the related  
8 growth in urban populations led to cramped (and often) unpleasantly noisy living  
9 conditions. As Picker notes, the streets were filled with the sounds of “clanging bells,  
10 cracking whips, clattering carriages, clamoring hawkers and cabmen, roaring crowds,  
11 barking dogs”, amongst other things.<sup>62</sup> The nature of the work undertaken in the  
12 factories itself also produced a great deal of noise. The running of steam engines and  
13 hydraulic presses, amongst other things, produced an incessant din that could overwhelm  
14 the uninitiated observer and potentially deafen the factory worker.<sup>63</sup> Referring to  
15 London’s soundscape in particular, this ‘din’ was condemned by many. For example, one  
16 commentator at the time declared a new ailment of the modern age – ‘Londonitis’ – that  
17 described the negative impact of such constant and loud noises upon the populations’  
18 nerves.<sup>64</sup> Frustrated by such distracting noise, and particularly the cluck of his neighbors’  
19 chickens, the author Thomas Carlyle famously attempted to build a ‘soundproof study’  
20 to insulate himself from such noises and so allow him peace and quiet in his home.<sup>65</sup> This  
21 was, then, very much “a period of unprecedented amplification, unheard of  
22 loudness...an age ‘alive with sound’”.<sup>66</sup>

23  
24 For some such noise might have been a sign or symbol of industrious progress  
25 and with that the expanding vitality of life in the metropolis.<sup>67</sup> It meant, for example,  
26 significantly expanded access to various forms of entertainment through the  
27 development of technologies that allowed for the mechanical reproduction of sound and  
28 music.<sup>68</sup> However, as the responses mentioned above suggest, for others this presented a  
29 very different situation. For example, Schafer has argued that this brought about a  
30 fundamental loss in the sonic ecology of both the city and the country. Schafer argues  
31 “The Industrial Revolution introduced a multitude of new sounds with unhappy  
32 consequences for many of the natural and human sounds which they tended to  
33 obscure”.<sup>69</sup> For others, it was more that there was simply a *change* in the nature of human  
34 noise practices and ‘ways of listening’ during this time. In fact, Thompson suggests that  
35 many of the long-present ‘organic’ noises of this time (of people and animals) remained  
36 key sources of annoyance and complaint amongst the population, and perhaps more so  
37 that the noises of industry.<sup>70</sup> Either way, for a range of individuals it was claimed that

1  
2  
3 living amid such changing soundscapes – soundscapes replete with the sound of people,  
4 animals, and machines, all in increasing volume and proximity – risked their productivity,  
5 mental wellbeing, and even physiological health.  
6  
7

8 Emerging from amid such concerns about the changing soundscape of the time,  
9 and with a particular focus on the sounds and noise of working-class leisure and trade,  
10 was a discourse which sought to make sound a terrain of governance.<sup>71</sup> A number of  
11 measures were taken to control these soundscapes, mostly through the identification of  
12 particularly troublesome sounds or sources of sound and the implementation of  
13 legislation to restrict their occurrence. For example, the so-called ‘cries of London’  
14 (heard from street traders) were an early target of such efforts to govern the city’s  
15 soundscape.<sup>72</sup> During the 1850s and 1860s in particular, though, it was increasingly  
16 suggested that the noise made by street performers had become an extreme and pressing  
17 problem. From that it was to become the task of affected members of the public to  
18 “demonstrate what great obstacles are opposed by street music to the progress of art,  
19 science, and literature, and what torments are inflicted on the studious, the sensitive, and  
20 the afflicted”.<sup>73</sup>  
21  
22  
23  
24  
25  
26  
27  
28

29 Complaints against street music reached their head with the street music debates  
30 in parliament across 1863 and 64. Here, street music was to encounter head-on the sorts  
31 of ‘institutional formations’ that Bonn talks about.<sup>74</sup> Specifically, an *Act for the better*  
32 *regulation of street music in the metropolis* was brought to parliament that proposed to repeal a  
33 section of the *Act for further improving the Police in and near the Metropolis*, and so limit the  
34 impacts street music had on/in the streets of the city. This Act identified various  
35 problems with the existing legislation that limited various members of the population’s  
36 ability to act effectively against such sounds and their sources. These problems related to,  
37 for example, who could complain (only the householder), where it applied to (only  
38 ‘thoroughfares’), and what evidence what required (it had to be witnessed by a  
39 constable). Of particular relevance here, though, was the reference in the legislation for  
40 there to be ‘reasonable cause’ for the complaint. Illness was specifically mentioned here  
41 as constituting such a reasonable cause. However, the ambiguity over what else could be  
42 deemed reasonable effectively meant the legislation could not be enforced. This issue had  
43 been compounded by instructions given to police constables late in 1859 which stated  
44 that they should only remove street musicians where illness was the issue and that they  
45 should not remove them for other reasons without first reporting to their sergeant or  
46 station. The Street Music Act was passed in amended form in 1864 and proposed that  
47

57  
58  
59  
60

1  
2  
3 any householder or person acting on their behalf could complain and so demand that a  
4 musician leave their neighbourhood “on account of the Interruption of the ordinary  
5 Occupation of Pursuits of any Inmate of such House”.<sup>75</sup>  
6  
7

8 While the revised Act was a lot clearer in terms of the grounds upon which  
9 complaints could be made and who could complain, the degree to which it made a great  
10 deal of difference to the soundscapes of the Metropolis at this time is questionable.  
11 Street music was to be a feature of the soundscape of the Metropolis for some time to  
12 come. Not only that, but also this persecution and very public ridicule of street musicians  
13 actually ended up romanticising their presence and contribution for some commentators  
14 who came to speak up in their defence.<sup>76</sup>  
15  
16  
17  
18

19 A number of themes come through in the various texts that appeared around the  
20 time of the street music debates that show quite clearly “how particular characteristics of  
21 sonic phenomena engage with particular spatial dynamics” and social contexts.<sup>77</sup> The  
22 issues covered therein can be understood collectively in terms of the particularly *intrusive*  
23 nature of street music and those musicians who played it. In looking into these debates  
24 and this intrusiveness in more detail, the remainder of the discussion here will unfold in  
25 three parts. The next section will consider how the disruption caused by street music to  
26 the ‘tone’ of public (and private) spaces was refracted through specific portrayals of these  
27 problematic and out of place performers themselves. This is focused particularly on  
28 tensions around national identity that permeated those discussions and the various  
29 imagined communities (and exclusions) that existed around this. The following section  
30 will show further how the various relational-affective capacities of the sounds that were  
31 heard were traversed by such portrayals and the judgements they were based upon. This  
32 will be illustrated through a reflection on the tensions that existed here between different  
33 classes and their specific tastes, and so how the experience of sound as noise was again  
34 mediated by such hierarchical ‘social formations’.<sup>78</sup> The subsequent section will look  
35 most specifically to the capacity of street music to trouble the bodies of those who  
36 listened, and so how it agitated the ‘nerves’ of some of those forced to listen to it while  
37 in their homes. This will focus principally on the case of Charles Babbage and both his  
38 characterization of the sounds he heard and the impact they had upon his capacities to  
39 act. Together, these three discussions show the ways in which the multi-layered identity  
40 politics of the time and the properties of the sounds produced themselves worked in  
41 concert and/or mediated each other in contributing towards the production of various

### 7 8 **5. Disturbing music made by disturbing musicians**

9  
10 During the time of the street music debates a range of types of street music could be  
11 heard in the metropolis. Comments were made, for example, about German brass  
12 bands, fiddlers, hurdy-gurdy players, amongst others. A particular figure of discontent in  
13 the street music debates, though, was the Italian organ grinder. In fact, “The Italian  
14 organ grinders came to be seen as the repulsive source of virtually all noise in the city”  
15 and it was suggested by many that “their eradication [was] the task of every ‘Friend of  
16 Tranquillity’”.<sup>79</sup> Such street musicians were deemed to be the lowest of the low. This was  
17 based on the quality of their contribution to this soundscape, but also in on their  
18 background, lifestyle, and the questionable ways in which they were seen to conduct their  
19 performances. The sounds and activities of this class of street musician were by far and  
20 away the most commonly mentioned and bemoaned amid the street music debates.  
21  
22

23  
24 Writing in the *Chambers Edinburgh Journal* in 1852, Mamby-Smith provides an  
25 instructive description of the sound of the grinding of organs. This was made up of:  
26

27  
28 “The piercing notes of a score of shrill fifes, the squall of as many clarions, the hoarse  
29 bray of a legion of tin trumpets, the angry and fitful snort of a brigade of rugged  
30 bassoons, the unintermitting rattle of a dozen or more deafening drums, the clang of  
31 bells firing in peals, the boom of gongs, with the sepulchral roar of some unknown  
32 contrivance for bass, so deep that you almost count the vibrations of each note...”<sup>80</sup>  
33  
34  
35  
36  
37  
38

39  
40 The questionable harmony, the piercing tone, the frequencies, and the repetition in this  
41 organ ground music were identified as fundamental issues for those who came to hear it.  
42 Such discordant mechanically reproduced sounds were particularly affective when it  
43 came to the impact they had upon the listener and the sorts of disposition that emerged  
44 towards those that played the music. And worse, many of those who came to hear it had  
45 little option but to hear it. The capacity of sound to pass through obstacles, “its property  
46 of penetration and ubiquity”, meant that it spilled over from public spaces into the  
47 domestic spaces of the more respectable population, meaning there was literally  
48 nowhere to ‘hide’.<sup>81</sup> The sounds of organ grinders imposed itself upon unreceptive  
49 members of the population and in spaces where it was not welcome.  
50

54  
55  
56  
57  
58  
59  
60

1  
2  
3 It is evident from the street music debates, though, how “The mounting  
4 calls...for all street musicians to be silenced or somehow swept away from respectable  
5 neighbourhoods showed just how easily the issue of offensive sounds could be  
6 transformed into a rather nasty form of social discrimination, even a kind of ethnic  
7 cleansing”.<sup>82</sup> Throughout *Street Music and the Metropolis* reference is made to the Italian  
8 organ grinders being ‘Savoyard fiends’ or ‘blackguards’ that smelled of a combination of  
9 garlic and goat-skin. They were also thought to live in overcrowded, filthy conditions in  
10 the less-than salubrious neighbourhood of Saffron Hill. Some of the specific language  
11 used here is instructive, particularly in the way that it dehumanized these performers. It  
12 was suggested, for example, that these street musicians ‘infest’ the streets having brought  
13 a ‘certain vice from Italy’, or their number meant that the streets ‘swarm’ with  
14 vagabonds. Using terms like ‘swarm’ and ‘infest’ that would normally be used in  
15 reference to insects or other creatures clearly set these performers apart from the more  
16 respectable inhabitants of the city and construct them as being ‘out of place’ in such  
17 spaces.

Such portrayals were reinforced by various illustrations that appeared at the time. Most prominently, these appeared in the pages of *Punch*. The illustrator John Leech drew many of these in light of his own troubles with street music and the way in which this was perceived to negatively impact upon his already faltering health.<sup>83</sup> These illustrations presented the grinders as variously dirty and sub-human. For example, Figure 1 draws upon Darwinian evolution in the way it portrays sub-human characteristics in the organ grinder through mirroring his posture with that of the monkey. Further, Figure 2 show streets that ‘swarmed’ with ill-kept performers, connecting to a general xenophobia directed towards these foreign invaders of the country, the streets, and the tranquillity of the Englishman’s home. Such concentration and characteristics were highlighted in an attempt to show how much these street musicians were contributing to the production of inhospitable public spaces with their activities.

60  
Based on the noise they made and their questionable character, it was argued that these immigrant performers should have lesser rights than the 'respectable' population to have a say over the content of the city's soundscape and be suppressed more effectively given their foreignness. As they performed in the 'Queen's highways' it was argued that such spaces should be open to citizens and not these foreigners. Some argued they were more "surely subjects of the Queen, more than the Italian organ-grinder is" and that "it is not liberty but tyranny, if he [the organ grinder] is permitted to ply his vocation so as to make us desist from ours".<sup>84</sup> There was very much a perceived distinction between who was in place, belonged, and had rights to being in and make use of the city's spaces, and who were 'out of place', didn't belong, and so has few or no rights to do such things.

Although set in motion as a result of the disturbance street music caused, these social spaces came to be constructed and portrayed with very specific visions for public life and who belonged and who did not belong within that. Returning to Bonn, the disturbance street music brought about was 'refracted' through and amplified by such imagined social distinction and differentiation from such foreign performers, meaning that their music was felt all the more strongly for those complaining given their self-proclaimed superior standing in society.<sup>85</sup> The affects such street music brought about cannot be straightforwardly unpicked from the feelings held by those who heard it towards those who played it. Each was mediated by, and amplified by, the other.

## 6. Class, taste and noise

Thinking further about the way the affects of street music came to be mediated through social formations, class-based social relations prove to be a quite significant if complicated area of debate for the way street music affected different listeners and through that produced various social relations and social spaces at this time. In this, such sound's situated/contextual affectivity emerges again as significant.

In the first instance, looking through the pages of Bass's collection it is striking who it was that was actually complaining. Contributors here included doctors, lawyers, music tutors, composers, ministers, and members of other professions that in some way required home-based working, mental rather than physical labours, and so claimed the

1  
2  
3 need for quiet to carry out their duties. Letters also appear from some very notable  
4 figures of the time. This included Charles Babbage, John Leech, Charles Dickens, and  
5 even the Harpist to the Queen. This raises something of a tension in Bass's case, though.  
6 Bass suggests early on in *Street Music and the Metropolis* that he received letters from all  
7 classes expressing thanks to him for taking up this issue and seeking to address it.  
8 However, on the very next page, he makes specific reference to the letters in his  
9 collection coming from members of the 'learned professions' and from 'literary and  
10 scientific men'. The representativeness of his selection of letters as portraying the  
11 opinions of the population of London in general is, then, very up for debate.  
12

13  
14  
15  
16  
17  
18 For some in the collection, though, such lines of questioning were to be easily  
19 dismissed. For example, a number of letter writers included in Bass's collection suggest  
20 themselves to be speaking on behalf of those lower classes who had confided in them  
21 their concerns. It was suggested that, "if the inhabitants were polled, the vast majority,  
22 rich and poor, would vote against organs, whatever they might say about the kinds of  
23 music".<sup>86</sup> Here it was not a case of class-based differences in taste being the issue, but  
24 that the music itself was played at all. However, other comments from the time suggest  
25 that class-based differences in taste were part of the problem, though that did not give  
26 grounds for alternative solutions. Many of the letters sent to Bass suggest that it was in  
27 fact the support given to street music by poorer members of society that meant the  
28 problem persisted. Echoing the sort of distinctions drawn against foreign performers,  
29 some of the bluntest statements showing such class-based tensions around the support  
30 of street music/musicians were posed in terms of what (and by implication, who) was  
31 more important: was it the entertainment of such lower classes of society, and so those  
32 individuals, or was it the industriousness of society's intellectuals? For example, one letter  
33 commented that: "The abolition of street music is most earnestly desired by a large body  
34 of the inhabitants of London. Its retention is desired probably by a still larger section,  
35 but one really of *comparatively little importance*".<sup>87</sup> Here the former are connected to the  
36 authors, the artists, and so on that laboured for the public good. The latter were seen to  
37 be made up of "household servants, and others, whose wishes cannot surely be of any  
38 importance when weighed against" those of the classes just mentioned.<sup>88 89</sup>

Amongst such debate, again, clear distinctions were articulated in terms of whom had the right to dictate the character of the metropolis's streets, specifically in terms of how they should sound. Any situation or suggestion to the contrary only came to amplify

1  
2  
3 the problem for those who perceived themselves or their activities to be of greater  
4 importance than those of the street musicians or their supportive audiences.  
5

6 References to differences in taste and class-based differences in worth,  
7 enjoyment, and support here draw particular attention to the relational nature of the  
8 disturbances brought about by this street music. It was noted at the time, if on occasion,  
9 that street music could make a positive contribution to the urban soundscape and so  
10 bring about positive affects for those who heard it. As Mamby-Smith recounted,  
11 “Perhaps the pleasantest of all the out-door accessories of a London life are the strains  
12 of fugitive music which one hears in the quiet by-streets or suburban highways – strains  
13 born of the skill of some of our wandering artists, who, with flute, violin, harp, or brazen  
14 tube of various shape and designation, make the brick-walls of the busy city responsive  
15 with the echoes of harmony”.<sup>90</sup> Such quality music could leave the listener “entranced”  
16 and with that “forgetful, not merely of all the troubles of existence, but of existence  
17 itself, until the last strain has ceased, and silence aroused us to the matter-of-fact world  
18 of business”.<sup>91</sup> However, Mamby-Smith was also quick to comment upon the ‘organ  
19 grinders’ who he deemed to distinguish themselves from such ‘artists’ in being “incarnate  
20 nuisances who fill the air with discordant and fragmentary mutilations and distortions of  
21 heaven-born melody, to the distraction of educated ears and the perversion of the  
22 popular taste”, with their “Music by handle”.<sup>92</sup> The greatest challenge to the campaign  
23 against street music, though, was that “a large part of the community applauds and  
24 rewards those musical performances which cause to other persons annoyance, and  
25 perhaps misery”.<sup>93</sup>  
26

30  
31  
32  
33  
34  
35  
36  
37  
38

39 Interestingly, the organ grinders themselves were aware, to some degree, of the  
40 varied tastes of their audiences. Some organ grinders from the time commented on the  
41 need to have a repertoire that would engage various classes within the city streets.<sup>94</sup> This  
42 did not necessarily solve the problem, though. Moving away from London for a  
43 moment, the character of organ ground music and its impact upon listeners disposition  
44 towards the music played were clearly noted by Tito Ricordi in 1858 in raising concerns  
45 within the context of an international congress on copy-right law. Ricordi commented  
46 that:  
47  
48  
49  
50

51 “It often happens that the finest thoughts of certain operas that have not yet been  
52 performed in a city receive publicity in advance by some means of travelling  
53 musicians and street organs [i.e. barrel organs]: usually they are reproduced with all  
54 sorts of cuts, with horribly alterations of harmony and inflections, with arrangements  
55  
56  
57  
58  
59  
60

1  
2  
3 that are so bad, that not only does the music lose its lyrical, dramatic, and vocal  
4 characteristic, but also the melodies themselves undergo the strangest  
5 metamorphoses. – The first impression of this music on the public has all the  
6 impression of monotony, of discordance, of vulgarity; the public is sated and  
7 disgusted with it in advance; to the point that, when it comes later on to hear the  
8 original performance, what is new seems old to it, the beautiful seems ugly,  
9 spontaneity is now just a triviality”.<sup>95</sup>  
10  
11  
12  
13  
14  
15

16 It was the case then that even when ‘good music’ was being played in the streets,  
17 for certain sections of the population these organs managed to transform such music  
18 into undesirable and disturbing noise, noise that could have lasting effects on those  
19 subjected to it. It wasn’t so much an issue of what was played in the streets, but rather  
20 *how* it was played, that affected some listeners the most.  
21  
22  
23

24 Such opposing positions on street music and its status as entertainment or noise  
25 draw attention to how difficult it is to define sound as noise clearly or objectively. While  
26 some of this status could be attributed to the specific qualities of the sound produced by  
27 street musicians in terms of a relationship between signal and interference<sup>96</sup> or its  
28 harmony – in terms of the sorts of discordance Ricordi decried, for example – not all will  
29 have judged such features to be all that problematic to their ability to appreciate what  
30 they heard. Volume could have played a significant part here in how they were affected  
31 in that for many “anything amplified to a deafening volume...is noise no matter how  
32 ‘pure’ its tone or ‘classic’ its pedigree”.<sup>97</sup> From that, the attribution of the label or status  
33 ‘noise’ comes not just the sound itself, but where and how it is heard. Street music’s  
34 status here as noise (or not) was constituted relationally. Sound out of place, no matter  
35 how pure, can come to be felt as noise.<sup>98</sup> The choice over whether to listen or not, or  
36 having sound imposed upon an individual or group, can be as affective if not more so  
37 than the specific character of that sound. In the case of the street music debates, the fact  
38 that the ‘rude majority’ did not confine their tastes for organ ground music to their  
39 homes but instead chose to enjoy it in the public spaces of the city at volumes that meant  
40 it pervaded the surrounding area and so was ‘imposed’ upon their neighbours who might  
41 have been less well disposed to these performances. As such, it was not that this music  
42 was inherently noise; rather such status emerged (or didn’t emerge) in light of how it  
43 affected the specific listener(s) based upon their past experiences, current activities,  
44

### 7. The 'Babbage Effect'

8  
9  
10 In thinking about the street music problem as it unfolded the public and private spaces  
11 of the Victorian Metropolis it is evident, then, that 'concerns' were raised about the street  
12 music itself as well as street musicians and their audiences. In concert, these concerns  
13 came to mediate and even amplify each other, and so the disturbance felt when street  
14 music was heard. The portrayal of the performers and audiences discussed over the past  
15 two sections was articulated precisely in response to and added weight to the principle  
16 issue of concern here: the physiological disturbance cause by street *music*. Having focused  
17 on the way that sounds and their impacts were mediated through various social relations,  
18 this section will focus most specifically on the embodied experience of those sounds and  
19 the sorts of "*corporeal* interactions and intersubjectivities set in motion" by it.<sup>99</sup> It will not  
20 forget, though, the sorts of mediation just discussed which are still relevant here.  
21  
22

23  
24 In thinking about the particularly affective nature of the sounds produced by  
25 street musicians, Charles Babbage's comments from the time stand out based on both  
26 their extent and veracity. A certain group of effects coalesced around Babbage and his  
27 responses to street music, and so could be thought of as something like a 'Babbage  
28 effect' that others also came to experience or with whose effect they identified (or not).<sup>100</sup>  
29  
30

31  
32 Echoing common Victorian proclivities, a key part of Babbage's *Chapter on Street*  
33 *Nuisances* was its taxonomic scrutiny of street music and its sources. Babbage listed all of  
34 the "Instruments of torture permitted by the Government to be in daily and nightly use  
35 in the streets of London".<sup>101</sup> These included: organs, brass bands, fiddles, harps,  
36 harpsichords, hurdy-gurdies, flageolets, drums, bagpipes, accordions, halfpenny whistles,  
37 tom-toms, and trumpets. Beyond this, Babbage also articulated certain common  
38 associations between instruments and the performer themselves: organs were attributed  
39 to the Italians, brass bands to the Germans, tom-toms to the so-called 'Natives of India',  
40 fiddles to the English, and so on. There was some hierarchical organization to such  
41 description and categorization, with the Italians being at the bottom, as mentioned  
42 previously.  
43  
44

45  
46 Such analytic aspects of Babbage's response noted, a central theme in Babbage's  
47 account relates to what the music played on these various instruments by various  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 individuals or groups *did*, to the physiological affect that street music could have on those  
4 forced to listen to it. Babbage argued that:

5  
6 “Those who possess an impaired bodily frame, and whose misery might be alleviated  
7 by good music at proper intervals, are absolutely driven to distraction by the vile and  
8 discordant music of the streets waking them, at all hours in the midst of that  
9 temporary repose so necessary for confirmed invalids”.<sup>102</sup>

10  
11  
12  
13  
14 Babbage’s comments here echo quite closely Deleuze and Parnet’s discussion of the two-  
15 sided nature of affect. In this they suggest that affects can work two ways, that  
16 “sometimes they weaken us in so far as they diminish our power to act and decompose  
17 our relationships...[and] sometimes they make us stronger in so far as they increase our  
18 power and make us enter into a vast or superior individual”.<sup>103</sup> Like Mamby-Smith,  
19 Babbage thought ‘good music’ might positively affect the ill or infirm. However, for him,  
20 street music rarely if ever was felt to be good. Babbage’s concerns were not, however,  
21 purely philanthropic. Babbage himself claimed that his own capacities to act had been  
22 diminished in light of his experiences of street music. He claimed that: “On a careful  
23 retrospect of the last dozen years of my life, I have arrived at the conclusion that...one-  
24 fourth part of my working power has been destroyed by the nuisance against which I  
25 have protested”. Echoing the discussion of class from the Section 6, Babbage also  
26 suggested “Twenty-five per cent is rather too large an additional income-tax upon the  
27 brain of the intellectual workers of this country, to be levied by permission of the  
28 Government, and squandered upon its most worthless classes”.<sup>104</sup> This clearly shows the  
29 physical impact of the music on the body listening and how this was mediated through  
30 and exacerbated further by macropolitical concerns over identity and his conceptions of  
31 the ‘worth’ of various members of the population. Babbage clearly notes how his  
32 capacities to act, to perform certain tasks were quantitatively diminished as a result of the  
33 disruptive effect of the street music and his desire to protest as a result.

34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47 It is interesting to note that the musicians and broader public who were  
48 supportive of street music were by no means passive or quiet in the face of Babbage’s  
49 actions. There were, in Babbage’s words, a number of ‘wilful disturbers of his quiet’.<sup>105</sup>  
50 Echoing Labelle’s comments about the two-sided role of sound or noise in the  
51 production of community<sup>106</sup> and Bonn’s on the ability of music to bring about specific  
52 types of social relation and imagined communities<sup>107</sup>, while many voices in the street  
53 music debates resonate with Babbage’s complaints against street music, these complaints  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 also also mobilized segments of the community in defence of the street music, or rather,  
4 in opposition to Babbage's reaction to it. This 'mob' took various steps to show their  
5 disagreement with his actions ranging from displaying placards in shop windows near his  
6 home, to posting him threats, to breaking his windows, to throwing dead cats into his  
7 garden. Equally, during his attempts to have a street musician stopped by the police, a  
8 large crowd would often form and follow him to the police station, shouting abuse at  
9 him as they went. Other residents in Babbage's area often invited musicians to play in  
10 front of his windows so as to deliberately disturb him. Further, those supportive of street  
11 musicians also sought to use sound as a weapon toward Babbage themselves, with a  
12 small number going "to the expense of purchasing worn out or damaged instruments,  
13 which they are incapable of playing, but on which they produce discordant noise for the  
14 purpose of annoying".<sup>108</sup> Here street music and its affects brought about a radical change  
15 in the social dynamics of these public spaces. It both aggregated and dis-aggregated  
16 various sections of the population, producing both community and confrontation.<sup>109</sup>

17  
18 As mentioned earlier, Babbage was not alone in noting the negative affects  
19 potentially brought about by street music. While Babbage's response may be considered  
20 somewhat extreme in terms of the lengths (and financial cost) he went to in complaining  
21 against the street musicians, he was not the only one to report a rather strong,  
22 debilitating reaction. For example, George Augustus Sala noted around this time that:

23  
24 "quiet as I am, I become at Eleven o'Clock in the Morning on every day of the week  
25 save Sunday a raving, ranting maniac – a dangerous lunatic, panting with insane  
26 desires to do, not only myself, but other people, a mischief, and possessed, less by  
27 hallucination than by rabies. For so sure as the clock of St. Martin's strikes eleven, so  
28 sure does my quiet street become a pandemonium of discordant sounds. My teeth are  
29 on edge to think of them".<sup>110</sup>

30  
31 Taking a step back from the specific content of some of these comments, an  
32 overarching theme amongst those complaining about the way they were affected  
33 physically by such sounds seemed to relate to their disposition towards the arrival of  
34 such sounds in the first place. Such affects were often discussed in terms of how it  
35 affected their 'nerves' or them having a particularly fragile or strained 'nervous  
36 disposition', a common if illusive malady that fell within mainstream medical discourse in  
37 Victorian England.<sup>111</sup> As one author in Bass's collection noted:

1  
2  
3 “To those like myself, in such health as over-worked citizens can be, with the nerves  
4 in constant tension, a ‘reasonable cause’ [for requesting the music cease], is  
5 tomfoolery. I go home from the City, the brain overwrought, feverish, and fatigued,  
6 and I require rest and change of occupation – reading, writing, and music – and these  
7 are impossible with the horrible street music from all sides – the very atmosphere  
8 impregnated with that thrice cursed droning noise – that abomination of London  
9 which makes me ill, which positively shortens my life from the nervous fever it  
10 engenders”.<sup>112</sup>  
11  
12  
13  
14  
15  
16

17  
18 In the context of the sorts of sensory changes taking place in society during the  
19 19<sup>th</sup> century discussed in Section 4, Georg Simmel’s discussion in *The Metropolis and*  
20 *Mental Life* becomes particularly interesting here.<sup>113</sup> In this Simmel reflected on the effects  
21 of this increasingly and constantly stimulating nature of city life on the emotional life of  
22 individuals. From that, Simmel suggested that to cope with this, the individual needed to  
23 make adaptations to their comportment. This meant adopting a ‘blasé outlook’, a  
24 distanced or indifferent disposition, whereby the individual’s nerves adjusted themselves  
25 so as to ‘renounce response’ to the intense experiences they undergo in the spaces of the  
26 metropolis. This again draws attention to the relational nature of such affective relations  
27 in that it is not just the thing perceived (i.e. the sound or noise) that is significant but also  
28 the ‘angle of arrival’ of the body that enters into that perceptual relation (i.e. that listens  
29 to it).<sup>114</sup>  
30  
31  
32  
33  
34  
35  
36

37 Although Simmel was writing roughly 40 years after the conclusion of the street  
38 music debates, and so within a different sonic setting, there are some interesting parallels  
39 here regarding the experience of organ ground music and the dispositions those  
40 subjected to these sounds adopted. In developing such an extreme aversion to the music  
41 played, and in making such a repeated conscious, even obsessive, response to it, it  
42 appears that Babbage and others failed to develop such a blasé persona. We could argue  
43 though that this failure resulted in part from the fact that these middle-class residents had  
44 nowhere to retreat from the over-stimulation of the metropolis’s streets; such inhabitants  
45 of the city had no possibility to develop any literal distance from which they could relax  
46 their nerves or allow such tensions to dissipate – a common ‘cure’ proposed for nervous  
47 illnesses.<sup>115</sup> This became especially problematic when certain individuals became the  
48 specific ‘target’ of a street musician’s performance. Either, as Pickers notes, “In  
49 assaulting the hearth, the ... organ grinding denied [them]...the pursuit of ‘rest’ so  
50  
51

1  
2  
3 essential to the life of proper gentlemen” or worse, for those without an office, it  
4 presented a risk for both their work *and* leisure spaces.<sup>116</sup> Either way, not only did they  
5 face the constant stimulation of the metropolitan environment, the sonic aspects of the  
6 stimuli also impeded into their homes, into “the very recesses of the ‘*Englishman’s*  
7 castle””.<sup>117</sup>  
8  
9  
10

## 11 12 13 **8. Conclusion**

14 The discussion of street music here has provided a clear example of the sort of role  
15 music and sound can play in the on-going production of social space, both in terms of  
16 how social spaces are felt and perceived by those that inhabit them, but also in terms of  
17 their character and conviviality (or lack thereof). In many ways, this has also shown how  
18 “we have always known about the intimate relationship between sound and affectivity,  
19 even if we haven’t expressed it in quite the same language”.<sup>118</sup> However, this case study  
20 has specifically shown how the affectivity of the sound of street music did not just  
21 emerge from that sound itself. Rather, it emerged relationally through its encounters with  
22 a variety of bodies. This was, at the same time, also mediated by a whole range of social  
23 relations, discourses, and formations. Specific understandings and discourses of the time  
24 considered here came to be associated with, and contributed to, the reception of street  
25 music and so the on going production of social spaces here. These representations and  
26 discourses were performative in that they intervened into the unfolding of the reality of  
27 these urban soundscapes and their affects; they acted to organize various bodies’  
28 capacities to affect and be affected and so disposed them in a variety of ways towards the  
29 music that was heard.<sup>119</sup>  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39

40 In affecting the listening body street music affected how life unfolded in social  
41 spaces, shaping social interactions as well as the embodied dispositions to those  
42 inhabiting these spaces. This was manifest in things as minor as a shift in an embodied  
43 disposition or mood of a listener (an agitation of their ‘nerves’), to manifest physical acts  
44 and interaction (like giving money or a resident confronting a performer), to collective  
45 displays (such as the formation of mobs), to outright acts of violence and dissent  
46 (including the hurling of dead cats). This did not play out against a neutral background,  
47 but rather came to be implicated in the specific time and place of the happening of that  
48 sound – one where concerns for the increasingly over-stimulating nature of life in the  
49 metropolis were growing in scope and fervour, specifically in light of the emergence of a  
50 home-working, educated middle-class. Such contexts for listening present “a social field,  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 itself multiple, which through its practices constitutes a field or population of subjects  
4 with varied affective and cognitive traits”.<sup>120</sup>  
5

6 This contextual happening of these sounds was mediated through a whole range  
7 of specific relations. Such affectivity was expressed in terms of how the sounds of the  
8 organ grinders, amongst others, impacted upon ‘the nerves’ of those forced to listen to it.  
9 Nervous conditions were both a product of medical discourses of that time but at the  
10 same time were clearly experienced as physiological affects coming from the social-  
11 spatial context that body inhabited at the point of experience. Further, rather than being  
12 a distinct register of social life, discourses around identity came to mediate such sonically  
13 induced nervous agitation, reinforcing and at times amplifying the intensity of the affects  
14 felt in light of the grinding of organs. In their combination, and in concert with other  
15 discourses such as those around class and taste, street music here had a significant  
16 physiological impact upon the listener and so produced what was felt to be an  
17 inhospitable noisy spatiality both in the city streets, but also, at times, in the homes of  
18 those forced to listen. This in turn had implications for how hospitable the streets came  
19 to feel for the performers, also. The affects, and so spaces, this music brought about  
20 were very much situational and came to be mediated by specific social and material  
21 circumstances.  
22

23  
24 In thinking about how sound happens and its role in the on-going production of  
25 social spaces, then, it is important to consider the situated nature of the taking place of  
26 sounds within, and their mediation through, various social-material-political contexts or  
27 circumstances. Intersubjective relations between sources of sound and/or listeners,  
28 temporary aggregations (and disaggregations) of affected listeners, hierarchical social  
29 relations and identity politics, and various institutional formations all can play a part in  
30 the reception and so affectivity of such sounds.  
31

Figure 1: Darwinism and the foreign organ grinder

Caption: The posture and pose of the organ grinder mirrors the monkey's to show connection between them (Source: Punch's Almanac for 1862, p. xix)

review

Figure 2: Streets swarming with grinders

Caption: Organ grinders were portrayed as filthy, unkempt, and physically limited, but also as overrunning the metropolis's streets (Source: Punch 45 (1863) p. 53).
