OMINOUS PARALLELS AND OPTIMISTIC DIFFERENCES: OPIUM IN CHINA AND AFGHANISTAN

James Windle

Abstract
This paper compares two of history’s largest producers of opium - Afghanistan (2000-11) and China (1917-35) - to suggest that in both cases production was facilitated by:
(1) A lack of central control over the national territory; (2) The existence of local power-holders; (3) Internal violent conflict; (4) The existence of a significant domestic opium consuming population.

The initial analysis is extended by introducing a successful opium production suppression intervention, The People’s Republic of China (1950s/1960s), to suggest that the control of opium in contemporary Afghanistan requires the Government to:
(1) Extend the state into isolated and hostile areas; (2) Facilitate a sense of self-interest in the Afghan Government and political elite towards opium suppression; (3) Facilitate a perception that suppression benefits opium farmers; (4) Strengthen the capacity to monitor opium farmers and enforce the law.

Keywords: Afghanistan; Alternative development; China; Drug law enforcement; Opium;

Introduction
The Afghan and Chinese opium trades have been well documented, however, no study has yet to compare the two countries at the peak of their respective production (1917-35 for China and 2000-11 for Afghanistan). While there are inherent difficulties in transferring experiences across time and space, there are extensive and insightful similarities between the experiences of history’s two largest opium producing countries. Furthermore, during the 1950s China, under the Communist Government, was able to remove all unregulated opium production from its national territory. Introducing Communist China provides an additional element to the comparative mix. This article shall provide in-depth narratives on the three cases which shall elucidate similarities and differences in order to provide experiences to contemporary drug policy.

1 James Windle- Lecturer in Criminology at University of East London, UK J.Windle@uel.ac.uk. The author would like to thank Graham Farrell, Sinead Drew, Lars Laamann and the anonymous referees for their thoughtful and constructive comments on early drafts.
The findings demonstrate how large-scale production in China and Afghanistan was driven by: (1) A lack of central control over the national territory; (2) The existence of local power-holders (i.e. warlords and government military commanders); (3) Internal violent conflict; (4) The existence of a significant domestic opium consuming population.

Whereas, the experience of Communist China suggests that a successful intervention requires: (1) A government which perceives suppression as in its best interest; (2) A government with authority throughout opium producing areas; (3) The provision of incentives for which farmers perceive some benefit to the cessation of production; (4) A state with the capability to monitor opium farmers and administer law enforcement. This article does not suggest the administration of a highly repressive intervention modelled upon the Chinese Communist Parties (henceforth CCP) approach, but rather the development of the structural means of suppressing production prior to administering any systematic law enforcement centred intervention. This paper shall provide detailed narratives of the three cases before presenting the findings of a cross-case comparison. The final section provides some preliminary suggestions for how the lessons learned could be transferred to contemporary Afghanistan.

1 China: Background and Context

During the early-1960s China removed a long standing prohibition on opium production in Yunnan Province to fund the suppression of the Panthay Uprising. Several other provinces followed this example and de facto legalisation preceded the official repeal of prohibition in the mid-1880s. China gradually overtook India as the world's largest source of opium and by 1905 Szechwan and South-West Hupei Provinces alone produced almost eight times that of India. Low prices and profuse availability increased consumption to exceptionally high levels. In 1890, an estimated 10 percent of the Chinese population smoked opium; this may have been as high as 60 to 80 percent in some areas, while as low as five percent in others. By 1906 official accounts suggest that between 30 to 40 percent of the population had

smoked opium. This said, the majority appear to have consumed small quantities and avoided heavy or habitual use.

By the turn of the twentieth century, China began to perceive opium as a threat to the productivity and health of the nation and in September 1906 issued an Imperial Decree declaring the gradual suppression of opium production, trade and consumption. In 1911, however, the Imperial regime was removed and a Republic declared. While there was an initial resurgence during the revolutionary period, production remained below 1906 levels and in 1912 the new President ordered all officials to renew suppression efforts. Observers from the British Foreign Office reported how the regime initially surpassed ‘the rigors of the Manchu rulers’. Both Imperial and Republican interventions were centred upon a highly repressive incarnation of law enforcement which pushed many farmers deeper into poverty. In 1917, a Chinese-British joint investigation declared all provinces of China ‘opium-

free’. The fragmentation of the state was, however, to make prohibition unsustainable.

2 China: 1917-1935

From 1911, numerous warlords had begun consolidating their authority separate from Beijing. In 1915, several warlords from Yunnan Province declared their independence. Then, in response to multiple uprisings in 1916, President Yuan Shikai abdicated. Responding to this opportunity, the majority of southern warlords declared independence whilst northern warlords fought over the central government in Beijing; essentially fragmenting the Chinese state. The warlords who ‘now controlled much of China, had a wide variety of backgrounds and maintained their power in different ways’; many had been part of the national military, others were provincial or district governors whilst some were:

...simply thugs...Some dominated whole provinces and financed their armies with local taxes collected by their own bureaucracies; others controlled only a handful of towns and got their money from “transit taxes” collected at gunpoint or through confiscation. Some warlords were deeply loyal to the idea of a legitimate republic,..., others believed Sun Yat-sen and the Guomindang represented China’s legitimate government...//.. Many... were capable of ferocities and erratic cruelty... but many others were educated men who tried to instil in their troops their own vision of morality.

The ‘warlord era’ brought:

...economic and social distress to China: opium poppies were planted in times of extreme famine, government administration became meaningless in many provinces, and the dislocation of legitimate trade impeded industrial growth and the modernisation of agriculture.

In short, it ‘brought the country to the brink of disaster’. While suppression officially continued in areas under Beijing – just two or three provinces around the capital – control of the central Government was unstable and composed of belligerent

northern warlords. As such, the British consulate reported the futility of approaching the impotent central Government to protest against increasing production.\(^\text{21}\) Especially as many warlords facilitated opium production to finance conflicts\(^\text{22}\) over territories, the central Government and areas important to the profitable opium trade.\(^\text{23}\)

British Foreign Office records suggest that dual authority often existed.\(^\text{24}\) Several provincial civil governments opposed opium production,\(^\text{25}\) while production was simultaneously facilitated by warlords. Some warlords extended advice on soil and irrigation management to improve yields\(^\text{26}\) and violently resisted civil eradication attempts.\(^\text{27}\) To ensure that opium was the only cost-effective crop, many warlords imposed extortionately high land taxes.\(^\text{28}\) More overt coercion included the fining or execution of farmers or village leaders refusing to produce opium.\(^\text{29}\) In some districts,

\(^{21}\) Dixon, *the truth about Opium*.

\(^{22}\) One Fukien warlord, for example, financed an expansion of 10,000 soldiers through taxing opium production: FO (1920), ‘H.B.M. Consulate, Foochow. Opium in Fukien. 20th April 1920’. TNA FO228/3361.

food crops were eradicated to make way for opium, contributing to famines in Kweichow and Shensi Provinces between 1921 and 1923, and food deficits in other provinces.\textsuperscript{30} This said, in other districts opium was profitable and farmers chose to acquiesce to warlord demands and/or openly resist civil bans.\textsuperscript{31}

Not all provinces grew opium. Civil authorities continued to brutally suppress production in Chefoo, Chungking and Shansi Provinces.\textsuperscript{32} Other civil authorities were apathetic or administered their own monopolies,\textsuperscript{33} often whilst publicly prohibiting production.\textsuperscript{34} By 1923, many civil provincial governments were recording opium taxes in their official treasury records and punishing unlicensed producers and merchants. The national military were also implicated in the distribution of opiates throughout China and into Burma and Indochina.\textsuperscript{35} During the early/mid-1920s national production averaged between 2,000 tons and 15,000 tons\textsuperscript{36} and accounted for anywhere between nine-tenths and 50 percent of global production. Illicitly exported

\textsuperscript{31} Bianco, ‘The Response of Opium Growers to Eradication Campaigns and the Poppy Tax, 1907-1949’.

Chinese opium was seized in: Australia; North America; the Philippines; East and Southeast Asia.\textsuperscript{37}

By 1928, the Kuomintang (‘National People’s Party’) had partly unified China under their authority and removed many competing warlords through military force or diplomacy; ending the so-called warlord era and providing China with the last nine-years of relative peace and order until 1949.\textsuperscript{38} The Kuomintang administered an opium monopoly which sold gradually decreasing quantities of opium to registered consumers.\textsuperscript{39} In 1928, the Kuomintang passed the Opium Suppression Act\textsuperscript{40} which criminalised all unregulated production and sale. Provincial and district officials were ordered to eradicate crops and punish re-cultivation. The Act was followed by a series of regulations which together allowed for the punishment of ineffective state officials and obliged magistrates to comply with the 1928 Act.\textsuperscript{41}

Nonetheless, unregulated production and sale continued, including the implication of the civil military in morphine manufacturing and illicit opiate trafficking.\textsuperscript{42} This said, strict prohibitions were enforced in areas where the Kuomintang were conducting anti-communist campaigns: ineffective magistrates were punished and farmers were executed.\textsuperscript{43}

\textsuperscript{38} Peace and order must be perceived in relative terms as the Kuomintang failed to protect the peasantry from the violence and exploitation of military forces: Bianco, \textit{origins of the Chinese Revolution}, 1915-1949.
Throughout the 1920s, opium continued to be produced in warlord controlled areas; perpetuating conflicts between warlord factions and the central Government. The Kuomintang delegate to the Hague Opium Conference described suppression as a ‘farce’ and declared that 12,090 tons were produced annually. Henry Woodhead, who considered the Kuomintang figure too conservative, dispatched a questionnaire to knowledgeable individuals on the opium situation. The findings suggested the continual compulsion of farmers by military and civil authorities to produce opium. Furthermore, national production had increased under Kuomintang protection with just three provinces actively enforcing prohibition.

In short, by the end of the 1920s production continued unabated, interdiction was unenforced and the Kuomintang were either helpless or facilitating production and distribution. In 1930, the League of Nations singled China out as the primary source of illicit opium in East and Southeast Asia, whilst Louise Eisenlohr described China as ‘the most serious menace to any scheme of universal control, either of drug manufacture or of opium cultivation’. Zhou Yongming reports how 1930 represented the peak of Chinese production; production ranged anywhere between 12,195 tonnes and 60,000 tonnes. While Kuomintang measures to reduce production after 1935 shall be discussed briefly below, the following section shall introduce history’s second largest opium producer: Afghanistan.

3 Afghanistan: 1950-2001

Afghanistan, which only became a major global source of opium during the mid-1950s, first prohibited opium in 1969. The ban was, however, under resourced and...
seldom imposed, especially during the periods of violent conflict after the 1978 coup d’état. The combined conflicts of the 1980s and 1990s devastated Afghanistan’s agricultural resources and rural infrastructure, leaving opium as one of the few available cash crops. A situation magnified by many Mujahedeen warlords facilitating opiate production, manufacturing and distribution. Production steeply increased throughout this period (see Figure 1).

**Figure.** Afghanistan: Opium production (1970-2007)

55 Vanda Felbab-Brown, *Shooting Up: Counterinsurgency and the War on Drugs* (Brookings Institute, 2010).
The 1992 overthrow of the Communist Government launched a period of ‘warlord rule’ where multiple warlords and criminal organisations fought for control of territory and the profits from illicit trades. Consequently, by 1994 Afghanistan had overtaken Burma as the world’s largest source of illicit opium. A modicum of stability was eventually established by the Taliban. While the Taliban initially enforced a strict ban on opium, by 1996 - aware of the resentment many felt at losing opium revenue - prohibition was repealed and the Taliban began protecting and taxing the trade. De facto legalisation increased the number of provinces producing opium from ten to 23.

In 2001, under international pressure, the Taliban once again banned opium production. Administering an intervention centred upon a highly repressive incarnation of law enforcement, the area under cultivation fell by 91 percent. The ban drove many landowners and farmers further into debt, facilitated widespread popular resistance and weakened the Taliban’s authority just prior to the American led invasion. During the conflict, rural infrastructures were further damaged and the state disintegrated into warring and rent seeking factions. Production increased on a steep incline from then onwards (see Figure 1).

4 Afghanistan: 2001-2011

In 2009, it was estimated that 1.9 percent of the Afghan population had consumed opium. While not as high as Imperial China, Afghanistan remains one of the world’s largest opium consuming populations. In terms of supply, for many of the Afghan political elite the opium trade is rewarding. Many warlords appointed to legitimate

62 Felbab-Brown, Shooting Up: Counterinsurgency and the War on Drugs.
political/bureaucratic positions after 2001 had previously exerted authority over aspects of the opiate trade.\textsuperscript{65} While formal ties with overt, criminal activity were rejected in order to enter legitimate state institutions, several former warlords exploited their position by protecting ‘former’ contacts.\textsuperscript{66}

A less iniquitous obstruction to the state (or political elite) from perceiving opium suppression as in their best interest may be the perception that a sharp decline in production would be economically and politically damaging. Afghanistan is one of the least developed countries in the world. The Government of Afghanistan have reported that 12 million individuals survive below the poverty line, while the UN has ranked it the fourth poorest country in the world in terms of food security.\textsuperscript{67} In 2009, opium was produced by 12.9 percent of the rural population,\textsuperscript{68} whilst a quarter of all economic activity was centred upon opium.\textsuperscript{69} Analogous to the 2001 Taliban opium ban, there is a concern that suppression would strengthen the insurgency and alienate rural populations.\textsuperscript{70} Hence, while the opium trade represents a barrier to long-term economic growth and foreign investment,\textsuperscript{71} support for a policy which could remove the income of a third of the population, destabilise the economy and ignite anti-government feelings is understandably low.

Afghanistan has ‘historically been characterised by a weak state in dynamic relations with a strong society’, resulting in a series of complex relationships between the state

and multiple ‘micro-societies’ based upon cultural, tribal or linguistic lines.\textsuperscript{72} While Kabul presently exerts fragile control over some of the national territory, parallel centres of authority exist throughout much of Afghanistan. Some southern and eastern areas are governed entirely by the Taliban, while in other areas governance is limited by an insurgency which has annually increased in intensity since 2002.\textsuperscript{73}

Even in areas with a significant state presence, the Government ‘has neither the capacity nor the legitimacy to mobilise capital or coercion’.\textsuperscript{74} Most state institutions are corrupt, lacking in adequate resources and trained personnel, and generally ineffective.\textsuperscript{75} Since 2005, the weaknesses of the Government, and high civilian casualties from the insurgency, have diminished popular support for Kabul and increased support for insurgent groups.\textsuperscript{76}

The weakness in governance and lack of state authority is most conspicuous in the criminal justice system: the vast majority of Afghans choose to use informal dispute resolution mechanisms, or even the Taliban, rather than the formal criminal justice system,\textsuperscript{77} which is under-resourced, undertrained and inefficient. Evocative of the entire system, the police are corrupt, abusive and criminalised.\textsuperscript{78}

Representative of state weakness is that since 2006, drug control has been centred upon the ‘Good Performance Indicators’ scheme and ‘Governor-led Eradication’ which motivate provincial and district governors to ban and eradicate opium poppies. Under the scheme, governors are rewarded with funding for development projects if their provinces can present significant reductions.\textsuperscript{79}

More often than not, governors must negotiate with local power-holders (i.e., warlords, strongmen or tribal leaders) to eradicate crops in their sphere of influence. Governor and local power-holder administered suppression has tended to centre upon law enforcement - including forced eradication and the threat of military attack - rather than the development of alternative incomes. The lack of developmental aid has pushed many (ex-)opium farmers deeper into poverty and debt. While the relationship between Kabul and governors, and between governors and local power-holders, is often unstable and reliant on negotiations. Many have sought the maintenance of insecurity for personal gain while there are reports that opium bans have been administered to control prices. Others have siphoned compensation intended for the farmer or funding for village development into their own pockets or inequitably distributed resources from those which need them the most.

Having discussed history’s two largest producers of opium the last case study will introduce a successful national intervention. Before introducing the intervention undertaken by the Chinese Communist Party (CCP), the intervening period between the Warlord and Communist era’s (1935-49) shall be summarised to provide some context.

5 The People’s Republic of China: 1935-49

By 1935, large portions of China were under Kuomintang authority and most western warlords had been integrated into the state, allowing the Kuomintang to administer the ‘Six-Year Plan’. Under the ‘Enforcement Measures for the Suppression of Dangerous Drugs’, the Plan provided for the gradual suppression of distribution and consumption by 1940: production was prohibition in all but eight provinces. Under a

84 The Plan is discussed in greater detail by: Baumler, ‘Opium Control Versus Opium Suppression: The Origin of the 1935 Six-Year Plan to Eliminate Opium and Drugs’; League of
state monopoly, farmers were licensed to produce gradually diminishing quantities for sale through the state monopoly to registered consumers and opium merchants were taxed by the state whilst transiting the Yangtze River to the markets of Shanghai and Hubei. Punishments for unauthorised production or trade were reported as ‘barbarous’: at least 263 individuals were executed in 1935 and unregulated crops were forcefully eradicated. Crop substitution was administered and by 1939, wheat was reported to be more profitable than opium in Hupeh and Kansu Provinces.

Several foreign observers were initially dubious of the national and provincial commitment. Some stronger warlords overtly resisted Kuomintang authority or clandestinely administered their own monopolies, while significant quantities of opium were diverted from the official monopoly. During the first year of the Plan, the League of Nations declared China the principal global source of both raw opium and manufactured opiates. Nonetheless, in 1937 President Chiang Kai-shek reported that the ‘cultivation of the opium poppy in the various provinces in the interior has long since been completely suppressed’ and was limited to a small number of districts in the ‘frontier provinces’. The statement was collaborated at the League of Nations by America and France, while the Foreign Policy Association reported that ‘the rising price of opium… had forced many to give up smoking’. Success, however, was limited by conflict. In 1937, Japan invaded and occupied the majority of

92 Merrill, Japan and the Opium Menace, p.46.
central Chinese provinces: fracturing the nine years of relative peace and stability.93 The Japanese military monopolised, and facilitated, opium production and distribution, which had practically ceased under the Plan.94

In 1939, the Kuomintang reported to the League of Nations that after one last purge - in which 159,449 hectares of poppies were eradicated, four farmers were executed and 25 imprisoned - almost all production had ceased in areas under their authority. Britain and Siam, however, complained that Yunnanese opium continued to be smuggled into Siam.95 This said, in a statement confirmed by the British Foreign Office, the Kuomintang Interior Minister declared that production was limited to Yunnanese border areas.96 The Province was declared ‘opium-free’ by the British Consulate in 1940. Conversely, the Consulate to Sichuan Province reported how opium was smuggled into the province from Sikang, Kweichow and Yunnan. Both consulates, however, reported that scarcity had inflated retail-prices.97

By 1937, production had declined to an estimated 890 tonnes.98 In 1941, when absolute prohibition was enacted, production was limited to Japanese occupied territories and the remote frontier areas99 of Yunnan, Kweichow and Sikang, where violent opposition to eradication was common.

97 League of Nations, Advisory Committee on Traffic in Opium and Other Dangerous Drugs. This data may not, however, account for clandestine production.
98 Merrill, Japan and the Opium Menace.
While American and British intelligence suggests that Chinese production remained low throughout the early-1940s, diminishing Kuomintang authority during the Sino-Japanese War (1937-45) and Civil War (1945-49) resulted in a resurgence in production as, once again, all warring factions profited from the production and trade in opium, in some cases compelling farmers. In 1944, the League of Nations reported that China produced 65.4 percent of the world’s illicit opium. In 1947, the League’s Permanent Central Opium Board stated ‘China may still be well at the head of the list of opium-producing countries’.

6 People’s Republic of China: 1949+

In 1949, the CCP expelled the Kuomintang from office and by 1952 had largely unified the country under their authority, renaming the country the People’s Republic of China. In 1950, the CCP promulgated the Decree Regarding Suppression of Opium and Narcotics which obliged: forced eradication in areas which had come under state authority; gradual reductions in areas inhabited by minority groups ‘in the light of the actual local circumstances’; complete prohibition on the distribution of opium (and other narcotics) and that all offenders be ‘severely punished’. It is widely acknowledged that production had ceased by 1953 in areas under state authority: minority areas lagged until the late-1950s after which production was minimal, sporadic and limited to remote areas of Yunnan.

The intervention can be split into three interlinking constituent parts: incentives, disincentives and social control. Together these increased the risk and decreased the rewards for producing opium. Furthermore, a number of factors converged to reduce

demand. The introduction of penicillin reduced the need for opium as medicine while recreationally it was increasingly perceived as old-fashioned, especially by the urban youth.\textsuperscript{105} Even as early as the 1940s British Foreign Office observers remarked that opium smoking had become unfashionable and ‘shameful’.\textsuperscript{106} Additionally, social control and repressive prohibition had inflated the risk for those who wished to consume opium.\textsuperscript{107}

\textbf{Incentives}

In ‘minority areas’\textsuperscript{108} crop substitution, land redistribution and, infrastructural and social welfare projects were administered prior to law enforcement to enable both state extension and drug control.\textsuperscript{109} A Chinese participant at a UN conference recounted how the CCP distributed improved seeds and modern technology to farmers throughout China to encourage them to grow grains and cash crops instead of opium.\textsuperscript{110} Several foreign observers described how food crops had replaced opium.\textsuperscript{111} In terms of cash crops, throughout the 1950s the CCP encouraged the production of tobacco and manufacturing of cigarettes: annual cigarette production increased from 80 billion in 1949 to 238 billion in 1958.\textsuperscript{112}

Precise information on crop substitution is, however, limited and CCP accounts and foreign observations appear somewhat inconsistent with Chinese agricultural planning. Between 1952 and 1957, agricultural productivity grew on average by 4.6 percent per year\textsuperscript{113} and by 1956/57 food access had improved\textsuperscript{114} although remaining

\textsuperscript{114} Spence, \textit{The Search for Modern China}. 
below international definitions of subsistence.\textsuperscript{115} Much of the success was attributable to private production, which was banned in 1958. Central control of agriculture, which was mismanaged by bureaucrats with little experience of agriculture,\textsuperscript{116} resulted in a famine which killed an estimated 18.48 to 30 million rural people between 1959 and 1961.\textsuperscript{117}

In 1958, the CCP implemented the ‘Great Leap Forward’ to modernise the state. As the development of heavy industry was an integral component of the plan, the majority of farmers were ordered away from agriculture to support iron production.\textsuperscript{118} Those remaining on agricultural duties were ordered to offset the diversion of resources by increasing the planting density of crops, as this was erroneously believed to increase yields. Furthermore, there was insufficient labour to collect even negligible harvests. The policy failed to produce large-amounts of iron whilst decreasing food availability.\textsuperscript{119}

Agricultural planning and management was ineffective during the period when the development of opium farming areas would have been administered. Thus, if developmental assistance was administered as an incentive for the cessation of opium production, the experience of the Great Leap Forward would suggest the inability of the CCP to provide effective alternative livelihoods, at least in some areas. The CCP did, however, provide opium farmers with alternative incentives.

A factor in CCP success during the three-year Civil War was that the Kuomintang had become increasingly unpopular with a rural population which had been ‘constantly subjected to forced labour and arbitrary taxation, constantly brutalised and plundered’ by soldiers and bandits. Massive inflation and the imposition of unequal taxation on agricultural crops had pushed many rural people’s further into poverty, meaning that ‘poverty, abuse, and early death were the only prospects for

\textsuperscript{115} Fairbank, \textit{China: A New History}.
nearly half a billion people’. Additionally, there was an awareness of the pervasive corruption of the Kuomintang, whilst war had highlighted the inability of the Kuomintang’s administrative capabilities. Many were quite simply tired of decades of constant violent conflict, abuse and insecurity.\textsuperscript{120}

The CCP, on the other hand, received significant rural support. The policies of land redistribution and landlord punishment were especially popular: in central-south China, an estimated 60 percent of the population benefitted from land reforms.\textsuperscript{121} As John Fairbank notes:

| Here was a conquering army of country boys who were strictly self-disciplined, polite, and helpful, at the opposite pole from the looting and raping warlord and troops and even departing… [Kuomintang]. Here was a dedicated government that really cleaned things up – not only the drains and streets but also the beggars, prostitutes and petty criminals… Here was a new China one could be proud of, one that controlled inflation, abolished foreign privileges, stamped out opium smoking and corruption generally, and brought the citizenry into a multitude of sociable activities to repair public works, spread literacy, control disease,…/… Only later did they see that the Promised Land was based on systematic control and manipulation.\textsuperscript{122} |

Therefore, the initial redistribution of land, removal of warlord and landlord exploitation, freeing of slaves, ideological affiliation, improved security and general promises of improved livelihoods under socialism may have motivated many to acquiesce to the cessation of opium production. This said, by the early-1960s, agricultural mismanagement - at considerable cost to human life - might have diluted revolutionary zeal. By this point, however, China had developed a highly repressive, intrusive and hegemonic state machine.

\textbf{Disincentives}

In late-1951/early-1952, the Three and Five Antis Campaigns identified - through investigates into official corruption - a number of large-scale traffickers. Following a nationwide intelligence gathering campaign, from August 1952 there were four nationwide waves of arrests, followed by extensive propaganda campaigns. The arrests ceased in October 1952 to allow the judiciary to catch-up: 82,056 of 369,705 individuals initially targeted had been arrested (34,775 were imprisoned or executed;

\textsuperscript{121} Spence, \textit{The Search for Modern China}.

\textsuperscript{122} Fairbank, \textit{China: A New History}, p.348.
2,138 were imprisoned in labour camps; 6,843 were placed under surveillance and 4,337 were ‘uncategorised’). 123 Opium poppies were forcefully eradicated. 124

Offenders were tried and punished during mass rallies in which 800 to 880 individuals were publically executed. Before the campaign the CCP had specified what percentage of those prosecuted were to be executed: enough to remove high-level traffickers, especially those deemed counter-revolutionaries, and inflate perceived risk to deter lower-level offenders from future transgression. 125 Annette Rubinstein witnessed:

... a policy of highly selective, strictly enforced, drastic punitive measures for major offenders on the one hand, and on the other hand amnesty and government support for victims and cooperative petty offender. 127

Carol Jones reports that the mid-1950s/mid-1960s were perceived by many as a ‘golden age’ of safety and order. 128 During this period punishments included execution, forced labour and administrative sanctions, such as forced resettlement or limited access to social goods. 129 While capital punishment was imposed by courts, some forced labour and administrative sanctions could be imposed by civil associations and a police force which possessed ‘virtually unlimited power in investigation, detaining, prosecuting and convicting criminal suspects’ and commonly punished extra-judicially. 130 Therefore, while the state may have executed ‘just’ 800 to 880 individuals, extra-judicial deaths or other physical punishments may have been higher. Punishments for production may have also been categorised as crimes against the communal production of food crops, counterrevolutionary crimes or linked to the more repressive aspects of minority ‘liberation’.

The severity of law enforcement dovetailed the level of authority possessed by the CCP in specific areas. In areas under CCP authority, bans on production were enforced quickly and centred upon public humiliation and executions, near constant surveillance and ‘administrative punishments’. Whereas in minority areas the state sequenced opium bans after administering policies of state extension and agricultural reform. This is illustrated with an example of the Liangshan Yi Autonomous Prefecture (Sichuan Province) where 50 to 80 percent of households produced opium. In the Han Chinese areas, suppression was conducted in synergy with the national campaign: opium was forcefully eradicated, 26 individuals were executed and over 300 were imprisoned. In ethnic Yi areas, the CCP initially projected propaganda and appealed to local leaders to cease selling to the Han Chinese population. Then, in mid-1954, the CCP began interdicting opium in Han areas and extending substitute crops in Yi areas. By 1955, Yi farmers voluntarily uprooted 1,072 hectares in exchange for substitute crops. An attempt by the CCP at forced eradication was, however, violently resisted. Then in 1956, the CCP administered ‘democratic reforms’ in Yi areas. As these included land distribution and the freeing of slaves they were popular with the Yi peasantry, who joined the CCP military in suppressing opposition to reform. By late-1957 all ethnic Yi areas were under CCP authority and prohibition was immediately enforced. As farmers did not want to jeopardise their newly acquired land or freedom and the primary facilitators of opium production (the landlords) had been removed, production decreased as acquiescence to prohibition increased. Then, in 1958/59, all opium was forcefully eradicated and 3,000 were arrested as drug offenders or counter-revolutionaries.  

Social control
Communism made people dependent on the state. In urban areas, necessities were rationed and housing, health care and education distributed through places of work. In rural areas land redistribution and collectivisation tied farmers to communal land. There was minimal freedom of travel or choice of employment. In short, China was a ‘police state’ with ‘unquestioned control over the populace in villages’.

Civil institutions – such as resident’s or women’s groups - were established in cities and rural villages and, alongside official coercive state institutions, ‘contributed to the formation of a social control network that could encompass every aspect of an individual’s life’ and was strong enough to ‘break connections even between family members’. Furthermore, fear of being a target for CCP criticism produced high levels of compliance whilst providing the state ‘a gaze far more “panoptical” than anything designed by Bentham’.

7 Cross-case comparison

This section shall summarise the three case study findings to elucidate some similarities and differences. The primary findings are illustrated in Table 1. China (1917-35) and Afghanistan (2000-11) are two of history’s largest opium producing nations. In both cases, the central government possessed limited authority over the majority of the national territory, much of which was controlled by local power-holders; many of whom were competing with other power-holders and the state for authority. Furthermore, many of the political elite failed to perceive the suppression of production as in their best interest for reasons of national interest and/or personal greed. Both cases were characterised by widespread domestic consumption. Where China and Afghanistan differ is that in China there was no real national attempt at suppressing production (until 1935); while in Afghanistan suppression interventions are officially a national priority.

The introduction of the People’s Republic of China into the analytical mix provides a case of a government capable of opium suppression, compared against two cases of incapable national governments. The People’s Republic of China is almost the reverse of the Afghan and earlier Chinese experiences. The centre possessed almost complete authority over its national territory, whilst violent conflict was minimal. The majority of the political elite perceived suppression as in their best interest from ideological and practical perspectives. There is little evidence of the state or its employees facilitating the trade, partly because of controls over corruption and the perceived benefits of suppression. The perception of opium as an old fashioned drug coupled with the efficient (yet unsavoury) suppression of opium consumption reduced the domestic demand for opium. In turn, reducing the farmgate.

price and lessening opposition to suppression. Furthermore, the CCP provided farmers with incentives to acquiesce to suppression; based upon loyalty to the Revolution, these included: land reform, the freeing of slaves and ideological affiliation. Revolutionary zeal also afforded the state the opportunity to create a highly intrusive surveillance network.

Unlike in Afghanistan, the CCP provided farmers with initial incentives to acquiesce to suppression. Only then - once the state had consolidated its authority and farmers perceived some benefit in suppression - were the highly effective (and repressive) law enforcement campaigns (supported by intrusive surveillance) administered.

Conclusions and Insights for Contemporary Afghanistan
This review of Afghanistan is not meant to be exhaustive but rather to illustrate a practical application of the comparative findings. The comparisons of the three cases suggests that suppression of illicit production requires four medium-term objectives: (1) The extension of the state into isolated and hostile areas; (2) The facilitation of a sense of self-interest in the Afghan Government and political elite towards opium suppression; (3) The facilitation of a perception that suppression benefits opium farmers; (4) The strengthening of the Afghan Government’s capacity to monitor opium farmers and enforce national law.

All strategies must facilitate these primary objectives; any that negate them must be discontinued. Analogously to the People’s Republic of China, the Afghan intervention must be designed as opium suppression mainstreamed into state extension. In the Afghan context, rural development\textsuperscript{137} and conflict resolution/limitation may represent effective means of supporting state extension, whilst providing incentives for farmers to accept opium bans. The establishment of a safer Afghanistan may represent the definitive incentive for the cessation of opium production. As one fieldworker reported the peoples ‘of Helmand would trade almost anything for [security and peace, and]… would follow anyone who could offer it.’\textsuperscript{138}

\textsuperscript{137} Opium production for the licit pharmaceutical market is an innovative approach which warrants further investigation. It is unlikely, however, that such a programme would be of benefit to the Afghan people nor the most efficient means of development in the current environment. See James Windle, ‘Poppies for Medicine in Afghanistan: Lessons from India and Turkey,’ accepted for publication in Journal of Asian and African Studies.
