A qualitative exploration of the Media’s Influence on UK Women’s views of Breastfeeding

Abstract

Background: In the UK rates of exclusive breastfeeding at 6 months are at 1%, highlighting the need to encourage and to improve the support provided to women to initiate and continue breastfeeding and to improve infant and maternal health.

Aim: To qualitatively explore the influence of media on the intention to initiate and continue breastfeeding.

Methods: This ethnographic study recruited forty women; 31 with children and nine of child-bearing age (19 to 28 years), with an intention to have children to take part in semi-structured interviews. Data was analysed using thematic analysis.

Findings: The thematic analysis identified five themes associated with sociocultural influences on breastfeeding perceptions and behaviour: family influence; privacy; media as a double-edged sword; negative exposure to breastfeeding; and planned behaviour versus experience.

Conclusions: Media influences strengthened pre-conceived notions of breastfeeding. Social media can play an important role in maintaining breastfeeding though support but can also put undue negative pressure on mothers who were struggling to breastfeed.
Update references – comments 3, 4 and 6
Palmer reference updated, Shortis reference changed accordingly and reference chronology updated

Clarify reference point – comments 5 and 7
Point 5 has been clarified and the second point has been removed with an updated literature search.

Comment 8 – interviews information to be extended
Interviews were phone-based and this has been added into the design and procedure section

Stats change (minor) – comment 9
Changed accordingly

Ethics committee ref number
Reference number added as requested

Comment 11 – study type
Study type added accordingly

Comment 12 – more detail on interviews
Requested details have been added into the participants section and the design and procedure section

Comment 13 – minor restructuring of method section
This has been structured as suggested

Comments 14-16, 18, 20 – move to discussion
These have all been removed from the results and added into the discussion section

Detail of sites noted by participants – comment 17
The three most commonly mentioned have been added here

Comment 19 – change to quote
A sentence has been added about this to the relevant theme

Comment 21 – add into discussion all previous points
Discussion of changing attitudes, law breaking by formula companies, lack of appropriate support, critical analysis of breast is best campaign

Added as requested

22 – update ref order
Updated – thank you

23 – antenatal classes
These points have all been added within the implications section of the discussion

24 – note ethnicity
This is an important point and has been added.

25 – reference style
This has been updated – thank you

26 & 27– note quote from table 3 that is highlighted & table 5
Now noted in both themes

CommentResponse
The manuscript is very interesting and significant to the situation of breastfeeding issues. However, the literature review that the author based on them to formulate his problem statement are old and not reflecting the problem now in UK. Most of the literature are older than 10 years, which need to be updated and the introduction needs to be rewritten. The literature has been updated to reflect the current evidence base. The literature review outlined by the female authors has remained broadly unchanged but more recent reference added to support the case.

The purpose of the study is not properly written, it is as a purpose of quantitative study, rewrite it please.

The authors were unclear on this point. We have added an additional line to make it clearer this is a qualitative investigation.

What is the design exactly, the author did not specify it if it was general qualitative or with specific approach. An ethnographic qualitative approach was used and this has been added accordingly.

What is the inclusion criteria that you used it clearly? it is not understandable in this way of presentation. These have been added into the participant section

Ethical considerations are not fully covered and described.

This section has been updated

I think you used a questions guide? can you provide as index?

This has now been added as an appendix

Presentation of themes is not informative, it is not appropriate to put quotes of themes in tables, you have to include them within the text flow.

These have been added within the text. We are aware though that this makes the article long so this will need to be at the discretion of the editor.

How did you maintain the rigor of the study? what the criteria that you use it? is it Guba and Lincoln criteria?

This has been added to the analysis section

Media impact on UK breastfeeding

**Reflective questions**

What norms and views around breastfeeding could health professionals address with pregnant mothers?

How can midwives provide information during the antenatal period to normalise breastfeeding behaviour?

How might professionals discuss media representations with pregnant mothers?

How could legislation be improved to reduce the biases in British media portrayals of breastfeeding?

How can we support mothers to navigate social media in a supportive way?
Introduction

The proportion of mothers in the UK who feed their infants with infant formulas has steadily increased (WHO, 2021). Despite information campaigns about the importance of breastfeeding for reducing infant illness and mortality (WHO & UNICEF, 2003), rates of breastfeeding in the UK drop from 68% at birth to less than 50% at six – eight weeks (Nicholson & Hayward, 2021). This places the national breastfeeding rates at one of the lowest internationally, higher only than the USA (Renfrew et al, 2012).

While many initiatives have attempted to improve breastfeeding rates in the UK (Shortis, 2019), decisions surrounding infant feeding tend to be made prior to pregnancy or in the first trimester (Sheehan et al. 2013) with factors such as; physical problems, embarrassment, social pressure, a lack of accurate information and unsupportive partners of breastfeeding women having an influential role (Hauck et al. 2010; Oakley et al. 2014; Feenstra et al. 2018). A literature review of breastfeeding discontinuation before 6 months identified that a lack of support (either from significant others close to the breastfeeding mother or from health professionals), poor physical or emotional health of the mother and an insufficient milk supply were the main reasons, other than maternal choice for early cessation of breastfeeding (Wray & Garside, 2018).

Mass media has been highlighted as an important sociocultural influence on breastfeeding in that it acts as a potential “proxy” for a lack of real-life exposure to breastfeeding (O’Brien, Myles, & Pritchard, 2017; Keevash et al, 2018) and influences public perceptions of infant feeding (O-Brien & Pritchard, 2017). The role of mass media in influencing breastfeeding behaviour appear to have improved over the year.
Media impact on UK breastfeeding

A content analysis of British newspaper articles published in 2000 (Henderson et al., 2000) revealed that, whilst the press were largely adhering to marketing guidelines surrounding infant formula (Infant Formula and Follow-on Formula (England) Regulations 2007), general coverage was presenting readers with mixed messages about breastfeeding. A more recent review suggests that portrayals of breastfeeding are becoming more positive (O’Brien & Pritchard, 2017). Despite these improvements, research from Brady (2012), and more recent research has identified many instances where marketing regulations of infant formulas are breached with few disincentives (Brady, 2012; Hastings et al, 2020).

The present study aims to complement existing research by qualitatively exploring the influences of British media, particularly social media, on women’s perceptions of breastfeeding and the impact this has on their choices and breastfeeding journey. This was achieved through an ethnographic interview approach with women during the early stages of their breastfeeding journey and those wishing to become mothers themselves.

**Method**

**Participants**

**Group A:** The inclusion criteria in Group A were that participants had to be of child-bearing age, not currently have children but have a desire to have children in the future. Group A consisted of nine women aged 19 to 28 years. These criteria were selected due to the evidence that many women have tentatively decided regarding infant feeding prior to (or in early) pregnancy (Sheehan et al. 2013), and therefore any media influences on these women would be highly relevant to the research question.
**Group B:** The inclusion criteria in group B were that participants had to have had at least one biological child. No restrictions were applied regarding age of or number of children, or the feeding methods used. Group B consisted of 31 mothers (20 to 46 years).

Participants were recruited through social media and came from across the UK. Recruitment took place between February 2014 and February 2017. Mothers in group B had between one and three children (eight months to seven years of age), had breastfed their infants at some stage with a range of breastfeeding duration from a few hours to over three years (mean = 12 months). Nine were still breastfeeding at the time of interview. Seven participants were from lower socioeconomic backgrounds. Participants were fully informed of the nature of the study and their right to withdraw at any time. Participants consented to take part by reading an information sheet and providing written consent. The British Psychological Society (2021) guidelines of ethical research practice were fully adhered to (BPS, 2021) and the study received ethical approval from the University ethics committee (Reference number 3371KS13/14). The participants were offered no incentives for taking part in the research.

**Design and Procedure**

The study used an ethnographic approach to qualitative research using interviews to gain a comprehensive understanding of social phenomena (Reeves et al, 2013). Semi-structured phone interviews were conducted lasting 30 minutes to one hour and comprised of two phases (see Appendix A for interview schedule). Interviews were conducted by the first author, a former doula or by the second author, an academic psychologist with experience of qualitative analysis. Both interviewers were female,
and both had children themselves and had experience of breastfeeding. The first phase aimed to establish existing general views, opinions and exposure to breastfeeding and formula use, and the second phase of questioning involved asking participants to discuss media footage. Mothers (Group B) were also asked about their own experiences of feeding their infants, method/s used and any influential factors they were aware of. Participants were then asked to discuss magazine, newspaper, and social media articles, as well as television and film coverage of infant feeding issues (including incidental imagery and advertising) that they had encountered. They were then asked to discuss their feelings about the content of discuss the content itself. The mothers were then asked to reflect on how this impacted on them in relation to their own experiences, and the women with no children were asked about any conscious effect this had on their potential future decisions, attitudes, and beliefs about breastfeeding.

Analysis

Interviews were transcribed and analysed using an inductive thematic analysis (Braun & Clarke, 2006). This flexible form of analysis allows examination of themes relating to sociocultural influences, lived experiences and more implicit factors influencing breastfeeding attitudes and behaviours (Figure 1). The first author independently read through an allocated number of transcripts each and familiarised themselves with the data. The researchers then re-read each transcript in turn, identifying codes (words or phrases) that summarised points. The researchers then independently revisited the codes and grouped them into meaningful clusters. For example, codes such as ‘intimate’ ‘personal’ ‘too public’ were clustered together. Once transcripts had been revisited to ensure all codes had been identified, the themes were named. The coding examples above were eventually renamed into the theme ‘privacy’ outlined in the
results section. Validity checking was performed on the data, with the second author validating the analysis. Where any disagreements existed, these were passed to the wider research team for discussion. The transcripts and analysis were also sent to participants for member checking. These processes were employed to ensure rigour of data analysis. The authors used the Guba and Lincoln (1989) criteria in the design, collection, analysis and write up of this work to ensure rigour throughout the qualitative research process. The sample size was deemed sufficient as data saturation had been reached, whereby no new themes or codes were identified in the last transcripts (Fusch & Ness, 2015).

Results

Five main themes were identified that influenced women’s perceptions of breastfeeding and their planned or actual behaviour: family influence, privacy, media as a double-edged sword, negative exposure to breastfeeding and planned behaviour versus experience.

Theme 1: Family Influence: “I think I always head it in my head to breastfeed”

The importance of exposure to breastfeeding in creating a normalised attitude was highlighted in the study. Several women had not directly witnessed infants being breastfed and therefore had not been given the opportunity to internally normalise it. Those who had directly witnessed it within their family were more likely to view it as the norm, as were those who knew they had been fed in this way as a child (Table 1).

“I think I always had it in my head, I know my mum breastfed all three of us, me my brother and sister, um and yes just kind of thought that was the thing to do really.” (B8).
Media impact on UK breastfeeding

“I always thought I’d want to bottle feed um so that it wasn’t until I became pregnant… I had no experience; I didn’t know anybody else who had breastfed, so I had nothing to go against…” (B9).

Family exposure did not always create a positive mind-set, with participants in both groups identifying that breastfeeding was something to be tried but with a degree of resignation that it would be painful, problematic, and short-lived. Many of the women in Group A referred to formula products as “regular powder stuff” (A1) and “normal milk” (A4). Perceptions of bottle feeding as the more convenient method was high among Group A and a commonly reported message from peers with children. Group B reported a tendency from their mothers, or partner’s mothers’, to disapprove of feeding beyond the early months. Overall, the participants expressed a positive attitude to breastfeeding with most feeling that it was something they had, or wanted, to try.

“I think they have done [friends have breastfed] but then they all seemed to go quite quickly onto the bottle. I think it just seemed more convenient for them or something like; they’re all quite young, so I think yes it was just more a convenience thing really.” (A4)

“I think that’s just literally friends telling me, oh my God when I put them onto bottle they slept better.” (A6)

“Once T got past 6 months, it was really, really strange and they were coming out with things like, you’re going to turn him gay.” (B6)

Theme 2: Privacy: “I wouldn’t necessarily want my husband looking at a bare breast whilst eating cucumber sandwiches”

The topic of feeding an infant in public was discussed by all participants with a focus on news-related debates surrounding the appropriateness of public breastfeeding in
Media impact on UK breastfeeding

certain locations. There was a common feeling across both groups that breastfeeding in public was unusual \(^\text{[Table 2]}\). The language used showed that breasts were viewed as a sexual, private part of the body and this view was circulated within family and peer environments.

“It takes your eye but then it’s just I suppose it’s natural…it’s just a bit unusual when you see it…” (A3)

“One of my good friends…she didn’t feel comfortable feeding her own daughter at her christening, which seemed ridiculous…it’s definitely not the norm...” (B6)

“I personally wouldn’t want some random bloke to get a glimpse of my breast in a café, that’s scary… So, it’s just that display of flesh isn’t it, it’s just it gets attention and actually to be honest I wouldn’t necessarily want my husband looking at a bare breast whilst eating cucumber sandwiches either.” (B7)

“People don’t feel comfortable getting their boobs out and breastfeeding in public generally” (B9).

“[we need]…more open attitudes to breastfeeding in our culture. I was very nervous to feed outside of the house with my first.” (B30)

**INSERT TABLE 2 HERE**

Women talked about media portrayals of breastfeeding in public, particularly social media campaigns highlighting cases where a feeding mother’s rights had been denied. The consensus feeling was that this news may be creating an issue where there did not need to be one. Participants felt that the focus of both journalism and social media tended to be on extreme cases, either where breastfeeding in public had been refused or shunned or promoting prejudice against mothers who were bottle feeding in public.

“…and media pressure to breastfeed, I would have been embarrassed feeding him a bottle in public” (B19).

“..as a mother who express feeds, I am very aware of the media coverage, particularly um facebook coverage about breastfeeding…I feel ashamed to bottle feed my baby in public…I want people to know I’m using breastmilk” (B31).
Media impact on UK breastfeeding

Theme 3: Media as a double-edged sword ““Social media is a nightmare”

Although most of the participants expressed a general lack of interest in news media generally, many mentioned frequent use of social media. A trend among Group B appeared to be to seek out information relevant to breastfeeding through social media. These sites (mainly Mum’s net and NetMums and NCT) seem to provide an important source of support for breastfeeding mums. Although these representations on social media suggest a useful role for media in promoting and maintain breastfeeding behaviour, other representations were viewed as being unhelpfully divisive in the point they were trying to promote. This was highlighted with reference to breastfeeding in public, the “breast is best” campaign, and the benefits of formula feeding (Table 3).

“Most media stories are about women being thrown out of cafés for getting their boobs out” (A7)

“I can’t remember really seeing anything about breastfeeding, except that one about the place in London that threw out a woman for breastfeeding. Other than that I can only think about the formula adverts really” (A9)

I think a more positive approach from all social sources, the breast is best debate seems to currently be fuelled by media and particularly social media, it’s damaging for both sides (B14)

Most of the women felt that such extreme media representations were unrepresentative of actual behaviour, but several did express that a real experience could hold more influence than information about breastfeeding. While some in each group believed that articles offering statistical and financial information about the importance of breastfeeding would offer a largely positive influence on new mothers, around half the women expressed concern that reports of this nature create an

INSERT TABLE 3 HERE
impression that breastfeeding is being pushed as a money-saving exercise for the NHS, disconnected from the health implications. The accuracy of the statistics was also questioned by many of the participants.

“You've got this government legislation persuading people, “Breast is best. You must breastfeed,” but there’s just such little support out there for making that happen...is this just about reducing NHS costs?” (B22).

“I've noticed a lot recently on social media about how important breastfeeding is and even some stuff about how formula can kill. I don’t know much about it, but that doesn’t seem right to me” (A8)

Participants highlighted how the nature of feeding discussions in parenting magazines and on social media created an air of pressure to breastfeed, mixed in with product advertisements, which were unhelpful and written in such a way that “if they can’t breastfeed it just makes them feel guilty, really guilty” (B3). This was further exacerbated by the lack of support (as noted above) for breastfeeding often present within the NHS.

“...from...media and other mums that there is an underlying shame attached to not doing so [breastfeeding]. ‘Breast is best’ but there needs to be more understanding about the reasons some women can’t breastfeed - the unbearable pain and lack of supply being perfectly acceptable ones” (B18).

“Social media is a nightmare - new mothers don't need the pressure. As long as baby is fed who really cares…” (B20)

The profit-making aspects of the formula industry were referred to by many mothers in discussion of parenting magazines and formula advertising. They felt patronised by them and found a lack of reasonable feeding features.

“I think every other page was an advert for a steriliser or a new bottle.” (B3)

“It was just like, 10 reasons why you’ll want to breastfeed, 10 reasons why you’ll want to formula feed... and it just treated me like I was just
Theme 4: Negative Breastfeeding Exposure “they have bottles in the background and asking each other to feed the baby”

Where exposure to breastfeeding had been lacking, several potential influencers in the media were discussed, in most cases reinforcing messages of breastfeeding as problematic or formula feeding as ‘convenient’.

Television advertising of formula appeared to be an important area of concern. The participants drew attention to the imagery used to create an impression that their product would be more convenient than breastfeeding (Table 4).

“Formula advertising & convenience is just the norm but people don't realise breastfeeding can be much more convenient” (B20).

“I can picture the baby formula ads…it's kind of shown to help and have all these benefits to help their development and all of this. Yes it's kind of shown like its equal to if you breastfed, you have the same benefits”. (A2)

“I see that they say about how the best milk you can have is…they say mother’s milk…and then they say just about what's in their nice formula and how it helps your child grow and fulfil their potential… the formula companies do tend to use the moving on kind of rhetoric to make you feel like there comes a natural point where it is wrong to carry on breastfeeding and it is right to move on to other stuff.” (B2)

The advertisement most frequently referred to, which shows an infant switching from breastmilk in a dark winter to enjoying artificial milk in bright sunshine, was typical of the nature of subtle imagery used. Whilst advertisements generally do adhere to guidelines, the careful wording describing their products creates a misconception that once an infant reaches six months, they can provide equal nutritional benefits to breastmilk (this, of course, is not explicitly stated).
When discussing wider forms of media representation, all participants stated that they had seen very little reference to how a baby is fed when they are shown on television or film. In soap operas, it was apparent that whilst they feature a lot of infants being born they only reported that “they have bottles in the background and asking each other to feed the baby” (A1). Whilst this is something that may not be overtly apparent to viewers, the presence of bottles and seeing mothers asking others to feed their children in this manner can only serve to subtly perpetuate the normative view of bottle feeding in a television scenario designed to resemble real life situations (albeit, highly exaggerated ones).

“Joey was there, and he found it quite arousing… like showing how women are all fine and it doesn’t bother them whereas men are a bit like whoa okay your boobs out.” (A5, referring to an episode of ‘Friends’)

Aside from soap operas, fictional representations of, or reference to breastfeeding, recalled by participants surrounded comedic sketches of sexualised image of breasts, extreme extended breastfeeding (of an adult male) and situations which would potentially fuel the perception that breastfeeding is not taken seriously.

“I watched a film recently where the mum, the breasts got way too big and they were full…she couldn’t breastfeed…and then there was a whole comedy scene based on the fact that they were like basically going to explode…It was quite a graphic scene as well, it’s quite shocking.” (A2, referring to the film ‘Bad Neighbours’)

Factual programmes of breastfeeding that were recalled tended to be ones of a shocking nature, such as those showing footage of much older children breastfeeding. This gave the impression of breastfeeding as something “disturbing in a way, because you don’t really see it going on that long” (A2). The prevalence of this type of story
Media impact on UK breastfeeding

appeared to create a level of support to many of their pre-conceived ideas that infants should only be breastfed for very short durations in case it becomes perceived as strange or unacceptable by others.

“...the woman with the very large child off her dangly breast. She was kind of really adamant about all the health effects for her, but not so much what the benefits for the child were... I do wander whether it’s to do with the mum not letting go or not letting go of that closeness, not allowing the child to be independent.” (B7)

“I remember watching a documentary about...sort of extended feeding and all the women on it just seemed like totally bonkers. Now I know a lot of people that do extended feeding and they’re really normal, it was like why couldn’t you have just used them?” (B6)

Theme 5: Planned behaviour vs. experience “by the time I had seen her, she’d already had several syringes of formula”

Every one of the mothers interviewed highlighted the fact that breastfeeding had not come as naturally or easily to them as they had anticipated before giving birth. Efforts from midwives during pregnancy to emphasise the health benefits to the child were expected, but the women frequently reported that, in hindsight, a great deal of information concerning the realities of lactation were omitted at this stage and left them feeling unprepared for common difficulties. This often-high-pressure approach from midwives to breastfeed, however, was universally mismatched with appropriate levels of support, training and availability after their children had been born (Table 5).

Participants highlighted the lack of support for breastfeeding within the NHS.

“You’ve got this government legislation persuading people, “Breast is best. You must breastfeed,” but there’s just such little support out there for making that happen...” (B22).

“...practise with knitted boobs and dolls and stuff...it just felt very divorced from reality, and I don’t really remember much practical advice from antenatal class... they just spouted the mantra breast is
In these situations, the generally negative experience of the women meant that they had been unable to initiate, or continue, breastfeeding. Two of the mothers reported that formula was so readily available while in hospital immediately post-birth that it was provided possibly as a convenience for the health professionals themselves, who did not offer new mothers adequate support and time in assisting breastfeeding with one mother even stated that her child was given formula before even being given the chance to learn how to express her own milk. One mother also recalled a conversation where a midwife openly expressed relief that no assistance with feeding was required as this was perceived as a nuisance. This contributed to reports that it was easier to start using formula than make further attempts to breastfeed their children.

“…by the time I had seen her, she’d already had several syringes of formula…No one approached me and said “do you want to try and express”, I was just left 9 hours.” (B10).

“The midwife would come over and I’d be breastfeeding fine and they would be so pleased, they’d be like, oh gosh you know some mums…oh! I have to see them all the time to help them breastfeed…” (B2)

“So I tried feeding him and then she came in and then she grabbed him and she twisted his head and pushed him on to me really hard… I rung the bell again and eventually she came in and she said, oh you again!” (B5)

“It was absolutely gutting, like I failed as a human being by not being able to feed him properly. I was made to feel that way…I just didn’t know what I was doing wrong and she was just terrifying and I couldn’t ask her for help because she frightened me so much.” (B1)

Discussion

This study has identified that breastfeeding is not necessarily seen as the normative
Media impact on UK breastfeeding

method of feeding an infant, particularly after the first few months, within the UK. The 'breast is best' campaign emphasises the importance of exclusively breastfeeding for the first six months of an infant's life, followed by the introduction of nutritional foods alongside breastfeeding up to, and beyond two years of age (World Health Organisation (WHO, 2011)). Yet, figures are showing little improvement across the UK (Nicholson & Hayward 2021). Initial views on breastfeeding prior to pregnancy were formed by an individual's prior experience and exposure to breastfeeding behaviour, either through their own social exposure, or through the media. Positive perceptions of breastfeeding prior to pregnancy and birth were espoused as a prime reason for commencing breastfeeding post-partum. Participants' inner social circle was the main influence; an awareness of how they were fed themselves as infants and the experiences of their mothers and other close family and friends. Those with familial experiences of breastfeeding were more likely to initiate breastfeeding behaviour, and more inclined to persevere with breastfeeding when problems presented. The importance of exposure to breastfeeding in creating a normalised attitude has been highlighted in previous research (Ogbuanu et al, 2009), in this study those with less exposure relied more heavily on the media to form their understanding of breastfeeding.

The findings support previous literature highlighting the importance of family support in initiating and persevering with breastfeeding (Remple & Remple, 2011; Maycock et al. 2013), but that this support alone is not enough to ensure successful maintenance (Rempel & Rempel, 2011). Appropriate support from healthcare professionals is an integral element to maintaining behaviour (Keervash et al. 2018).

The findings from this study show a clear role for mainstream media, advertising, and social media in influencing women’s preconceptions of breastfeeding.
Participants in this study supported the findings of previous research suggesting that British media coverage of breastfeeding tends to be relatively sparse. Although many participants in this study were less concerned with direct media coverage relating to breastfeeding, subtle messages such as babies on soap operas being shown with bottles while mothers continue life as normal serve to perpetuate their notions of breastfeeding as inconvenient. This supports previous research by Henderson et al (2000) that identified a distinct lack of breastfeeding representation throughout British media. The advertising of formula products was found to add to this with imagery conveying an idea that their product is more convenient and of similar nutritional composition to breastmilk. Adhering to national legislation (Infant Formula and Follow-on Formula (England) Regulations, 2007), advertising is limited to formula intended for children over the age of six months with specific rules on what advertisers can and cannot include. These rules are often violated with minimal consequences for companies (Hastings et al, 2020). Breastfeeding is also shown to be outside of the norm through its use in comedic contexts with reference to sexualised attitudes towards breasts, uncomfortable perspectives on extended breastfeeding, and the painful and messy aspects of breastfeeding itself. Influences such as these may have appeared trivial on the surface to the participants but combine to perpetuate the notion of breastfeeding as an unusual act.

Limitations

The study allowed participants to openly discuss issues of breastfeeding, both positive and negative, within the context of sociocultural influences on perceptions and behaviour. The study was designed using a qualitative approach in order to better understand the experiences of women who have breastfed, and the influences on those who have yet to breastfeed. While this allowed for rich detail data collection, the
study cannot necessarily be extrapolated to a wider population of women who breastfeed, or to those who may breastfeed in the future. It is important to note, that the nature of the sampling meant that the participants did not represent a broad socioeconomic range and were not ethnically diverse. Therefore, the experiences of those from more deprived parts of the UK were not represented.

**Implications for practice and policy**

Whilst efforts are being made to increase breastfeeding rates through campaigns such as the exclusive feeding initiatives introduced by the World Health Organisation (WHO, 2011), rates in the UK are still very low (Shortis, 2019). As such many young women within the UK are unlikely to have direct experience of breastfeeding, which in turn is likely to perpetuate low rates. A possible solution to this is increased public exposure to breastfeeding through public health initiative to raise the profile of ‘normal and healthy’ breastfeeding. Sadly, this study also identified a continuing concern among many women about breastfeeding in public, despite legislation to protect their rights that participants seemed largely unaware of (Equality Act 2010). This coupled with unhelpful and negative media portrayals of breastfeeding, and a continued representation of bottle feeding as the ‘norm’ means that young women within the UK are still not being exposed to the positive breastfeeding experiences that may promote breastfeeding self-efficacy, despite some improvement in media portrayals over the last decade (O’Brien et al, 2017). Additionally, training for staff in public places needs to be improved to ensure the rights of those who wish to breastfeed in public. This in turn would increase the prevalence of public breastfeeding and make the behaviour more normative and visible among younger women.

These elements, in conjunction with the identified lack of support from healthcare
Media impact on UK breastfeeding professionals, would seem to come together to create a ‘perfect storm’ to prevent women in the UK from initiating or continuing with breastfeeding long-term. Therefore, greater support is needed among healthcare professionals to ensure mothers have the help they require to successfully breastfeed by renewed commitment to the baby friendly imitative programmes currently run across the UK. This, alongside more information of the process of breastfeeding and how to overcome difficulties provided in the antenatal period may reduce the cessation rate currently seen in the UK (Keevash et al. 2018). There needs to be wider discussions within NHS services about how time pressures and lack of funding within services are influencing a reduction of breastfeeding initiation and ability to breastfeeding longer-term (Keevash et al, 2018). Another aspect of practice improvement should be to consider carefully wording of public health campaigns such as ‘Breast is best’, which while well-meaning can lead to a greater sense of pressure and guilt among mothers who struggle to breastfeed (Keevash et al, 2018). Improvements need to be made to antenatal services to ensure there is adequate resources to provide vital information about breastfeeding to promote realistically to women to encourage them to opt for breastfeeding prior to birth (Keevash et al, 2018).

Conclusions

This current study aimed to explore the influences of media and social media on women’s perceptions of, and intentions to, breastfeed. The study identified that a lack of positive portrayals of breastfeeding in a range of contexts, including the family, in public, and through the media, often leaves young women with a negative view of breastfeeding as a normative behaviour. Exposure to negative media representations of breastfeeding and divisive social media campaigns, coupled with poor support from health care professionals were identified as key influences in preventing long-term...
Media impact on UK breastfeeding breastfeeding behaviour. Future public health campaigns need to focus on promoting a more positive, yet balanced, perspective on breastfeeding alongside greater attention to the mainstream media and social media portrayals of breastfeeding. Greater emphasis should also be placed on ensuring formula advertising within the UK is mediated by greater positive representations of breastfeeding.

Appendix A: Draft Interview Schedules

Group A: Non-Mothers Group

1. As a woman who doesn’t have children, can you tell me what you know about breastfeeding in general?
   - Family and friends’ experiences?
   - Seeing people feed in public?
   - General knowledge
   - Awareness of how participant was fed as a baby?

2. And how about formula/bottle feeding?
   - Family and friends?
   - Seeing people feed in public?
   - General knowledge

3. How do you feel about breastfeeding in general?
   - Feelings seeing people feeding in public
   - Positive/negative experience
   - Natural
   - If no prior exposure, where do you think this view came from?

4. Can you think of any examples of news stories or magazine articles you’ve seen about/featuring breastfeeding?
   - Health information/“real-life” stories/columns.
   - Newspapers/magazines/parenting magazines.
   - Did that article support or change your opinion? Why?
   - Feelings/emotional reaction – e.g. if article was strongly biased towards particular method.
   - Use of images?
   - Celebrity endorsement / social class issues?

5. (Unless already discussed above) Have you seen any discussions or stories about breastfeeding on TV? For example, on the news or a magazine/daytime show?
   - Health information/“real-life” stories.
   - Did that feature support or change your opinion? Why?
   - Feelings/emotional reaction – e.g. if feature was strongly biased towards particular method.
   - Use of images?
   - Celebrity endorsement / social class issues?
6. Can you think of any fictional TV programmes or films that have featured a baby being either bottle- or breast-fed, or it being talked about?  
   - Soap operas, sitcoms, boob jokes, formula & bottles in view.  
   - Describe what happened – positive or negative presentation?

10. Open discussion of a presented positively-framed article about breastfeeding.

11. Open discussion of a presented negatively-framed article about breastfeeding.
   - Would the headline grab your attention?  
   - What impression of breastfeeding does this article give you?  
   - Emotion reactions  
   - How do you think this article would affect someone trying to make a decision re. infant feeding?  
   - Factual vs. opinion writing

Group B: Mothers Group

1. How many children do you have?  
   - Ages?

2. How did you feed your child/children?  
   - If breastfed, for how long?  
   - All children fed the same way?

3. (If breastfed) Can you recall when/how you made the decision to breastfeed?  
   - If different for each child – why? / Experience with previous children?  
   - Influences  
   - Support from partner/family?

4. (If bottle-fed from start) Can you recall when/how you made the decision to bottle-feed?
   a. If different for each child – why?  
   b. Influences  
   c. Support from partner/family?
5. (If breastfed) Could you tell me about when you stopped breastfeeding your child/children?
   - Duration.
   - Physical problems/family and friends/outside influence?

6. Can you tell me about your thoughts about breastfeeding before you were a mum yourself?
   - Seeing family/friends/strangers in public – how did this make you feel?
   - If no prior exposure – where do you think this idea came from?
   - Do you feel this affected your own decisions / behaviour – e.g. feeding in public?
   - If your attitude changed when baby was born – why?

7. Had you seen any newspaper/magazine/TV coverage of breastfeeding before you were pregnant?
   - Did it change/influence/reinforce any existing attitude?

8. Can you think of any examples of news stories or magazine articles you’ve seen about/featuring breastfeeding since becoming a mum?
   - Health information/“real-life” stories/columns.
   - Newspapers/magazines/parenting magazines.
   - As a breastfeeder/bottlefeeder, did that article support or change your opinion/inform/alter your decisions?
   - Feelings/emotional reaction – e.g. if article was strongly biased towards particular method.
   - Use of images?
   - Celebrity endorsement / social class issues?

9. (Unless already discussed above) Have you seen any discussions or stories about breastfeeding on TV? For example, on the news or a magazine/daytime show?
   - Health information/“real-life” stories.
   - As a breastfeeder/bottlefeeder, did that feature support or change your opinion/inform/alter your decisions?
   - Feelings/emotional reaction – e.g. if feature was strongly biased towards particular method.
   - Use of images?
   - Celebrity endorsement / social class issues?
